Agenda

- Background
- WebSphere CloudBurst Appliance – overview and components
- Virtual images and supported hardware
- WebSphere CloudBurst - life cycle
- Security, Users and Groups
- WebSphere Process Server Hypervisor Edition
- Appliance Management and Data Center Integration
- Demonstration
- Other enhancements
 - Virtual system snapshot and restore
 - Extending virtual images
 - Applying maintenance
 - Securely backup and restore
 - Multi-image patterns
 - SNMP management
 - Dynamic virtual machine operations
 - Licensing
- Automate Pattern customization with Rational Automation Framework for WebSphere
- Summary

Background

Hardware challenges

- Costs to manage systems have doubled since 2000
- Costs to power and cool systems have doubled since 2000
- Devices accessing data over networks doubling every 2.5 years
- Bandwidth consumed doubling every 1.5 years
- Data doubling every 18 months¹
- Server processing capacity doubling every three years²
- 10G Ethernet ports tripling over the next five years

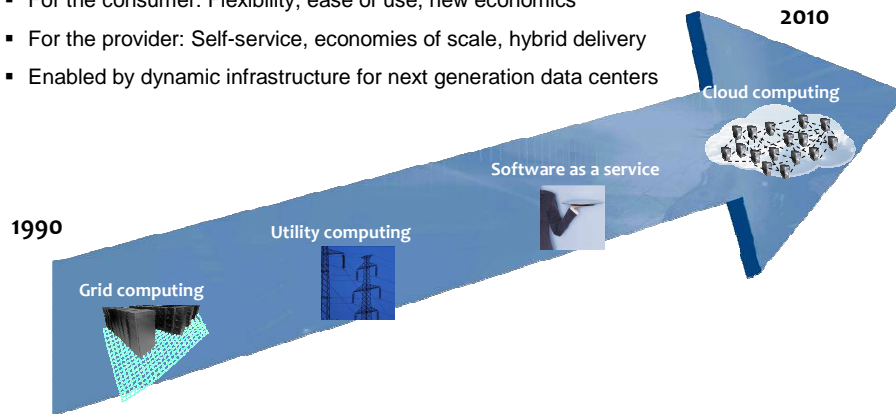

Cloud computing – a disruptive new paradigm

“Clouds will transform the information technology (IT) industry... profoundly change the way people work and companies operate.”

The Economist

- A new paradigm for consumption and delivery of IT-based services
- For the consumer: Flexibility, ease of use, new economics
- For the provider: Self-service, economies of scale, hybrid delivery
- Enabled by dynamic infrastructure for next generation data centers

WebSphere CloudBurst value proposition

- The business value of WebSphere CloudBurst is to increase efficiency, cost-effectiveness, and usability of WebSphere Application Server topologies in a data center by leveraging cloud computing principles
- WebSphere CloudBurst appliance uses key technologies
 - Server virtualization capabilities such as server consolidation, isolation and rapid provisioning
 - Virtual appliance brings with it hardened configurations allowing for repeatable deployments

6

WebSphere CloudBurst Overview and components

WebSphere CloudBurst is...

- **An appliance from IBM...**
 - Includes:
 - Hardware with built-in security and trust authority
 - WebSphere CloudBurst function
 - WebSphere middleware images
 - WebSphere middleware patterns
- **...that manages your on-premise cloud...**
 - Bring your own enterprise cloud:
 - Hypervisors
 - Storage
 - Network
- **... comprising of WebSphere Middleware Server virtual systems**
 - Customize and extend images and patterns for your applications
 - Dispense and run in the cloud
 - Life cycle management and optimization

Components of a WebSphere cloud

- Virtual images provide core components for building virtual systems
 - **WebSphere Application Server Hypervisor Edition**
 - **WebSphere Process Server Hypervisor Edition**
 - **DB2 Hypervisor Edition**
 - ...
- **WebSphere CloudBurst Appliance** hosts virtual images in its catalog and dispenses them to your private cloud
- **Private cloud** – set of Hypervisor servers (like ESX Server) hosting virtual systems managed by WebSphere CloudBurst, and set of IP addresses to be used by virtual systems

WebSphere Application Server Hypervisor Edition

- WebSphere Application Server product designed to run in a virtualized cloud environment
 - Currently available for V6.1 and V7.0
- Packaged as a pre-installed and configured image in open virtualization format (OVF); includes
 - Operating system – Suse Linux or RedHat Linux
 - Application server binaries
 - Application server profiles
 - HTTP server
- Image include parts that represent the application server topology components the image supports
 - Examples: deployment manager, custom node, stand-alone server

Hypervisor and Cloud resources

- The cloud is made up of the hardware, software, and network resources that host deployed virtual systems
- Cloud resources exist outside the appliance, but must be defined in the appliance configuration
 - **IP group:** a collection of IP addresses that are available for virtual systems to use
 - **Hypervisor:** a system running virtualization software, allowing multiple operating system virtual machines to access underlying hardware
 - **Cloud group:** a group of related hypervisors, used as a target for deployment

11

SHARE in Boston: IBM WebSphere CloudBurst Appliance

© 2010 IBM Corporation

Supported Middleware Hypervisor editions - Virtual Images

- WebSphere Application Server V6.1 and V7.0
 - All V6.1 Feature Packs - EJB 3.0, Web Services and Web 2.0 Feature packs
 - All V7.0 Feature Packs – SCA, CEA, XML Feature packs
 - IBM HTTP Server
 - IBM HTTP Server Plug-in
 - IBM Update Installer
 - IBM Support Assistant
- IBM WebSphere Application Server Hypervisor Edition Intelligent Management Pack 6.1.1 (for WebSphere Application Server V7.0.0.11)
- WebSphere Process Server V6.2 and V7.0
- DB2 Enterprise 9.7

**Not all combinations are supported on all platforms
Refer to the Information Center for details including release levels**

12

SHARE in Boston: IBM WebSphere CloudBurst Appliance

© 2010 IBM Corporation

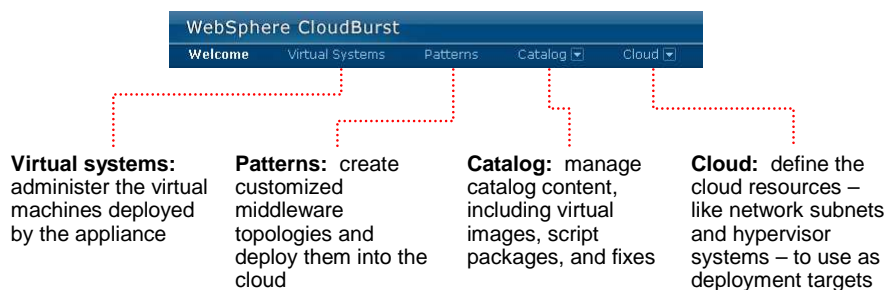

Supported Hypervisors and Operating systems

- VMware ESX 3.02, 3.03, 3.5, 4.0 and VMware VirtualCenter
 - RedHat Linux® 5.5 Enterprise server (32-bit)
 - Novell SUSE Linux Enterprise Server 11 (32-bit)
- PowerVM 5 and 6 with IBM Systems Director VMControl
 - AIX® 6.1.3 (64-bit)
- z/VM
 - Novell SUSE Linux Enterprise Server 11 for 390 (64-bit)

**Not all combinations are supported on all platforms
Refer to the Information Center for details including release levels**

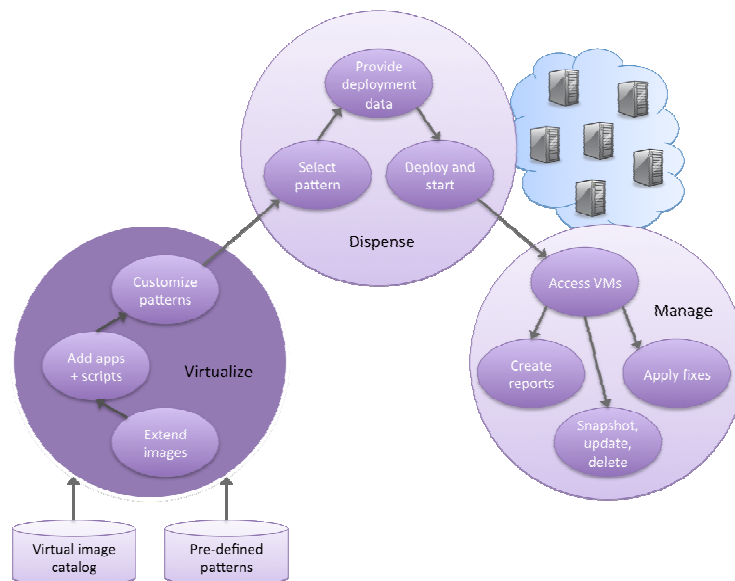

WebSphere CloudBurst Appliance components

- WebSphere CloudBurst is a physical appliance that is designed to deploy and manage virtualized WebSphere Application Server environments
- Administrative capabilities of the appliance are available for:

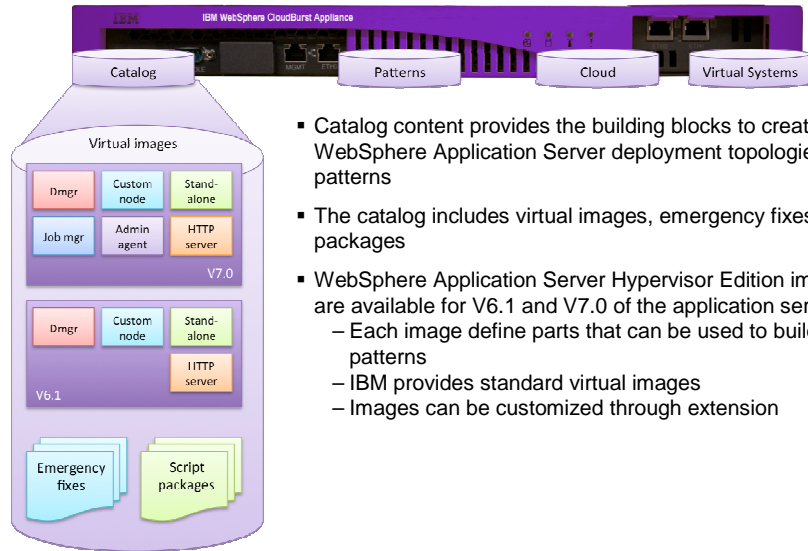

WebSphere CloudBurst life cycle

WebSphere CloudBurst life cycle – virtualize

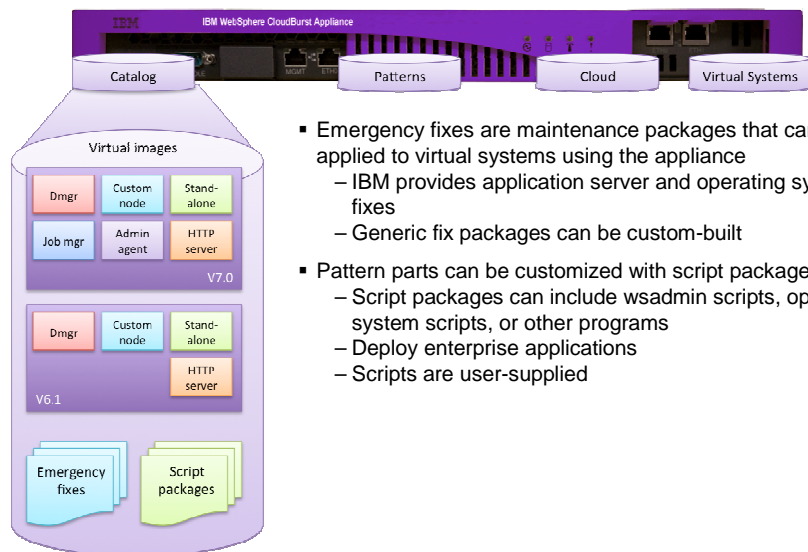

Catalog – virtual images

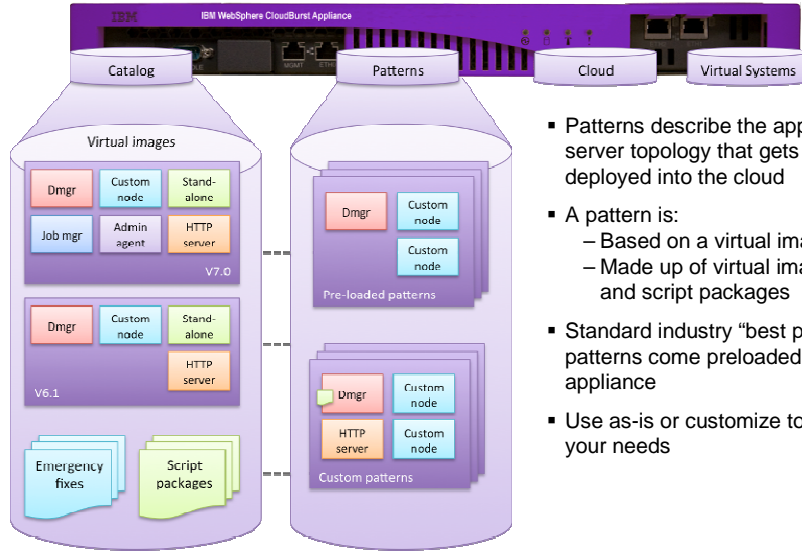

- Catalog content provides the building blocks to create a WebSphere Application Server deployment topologies, or patterns
- The catalog includes virtual images, emergency fixes, script packages
- WebSphere Application Server Hypervisor Edition images are available for V6.1 and V7.0 of the application server
 - Each image define parts that can be used to build patterns
 - IBM provides standard virtual images
 - Images can be customized through extension

Catalog – emergency fixes and script packages

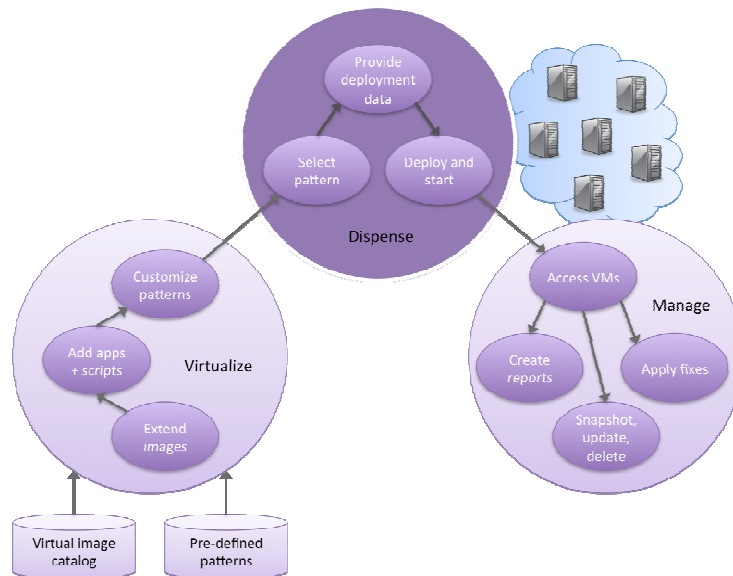

- Emergency fixes are maintenance packages that can be applied to virtual systems using the appliance
 - IBM provides application server and operating system fixes
 - Generic fix packages can be custom-built
- Pattern parts can be customized with script packages
 - Script packages can include wsadmin scripts, operating system scripts, or other programs
 - Deploy enterprise applications
 - Scripts are user-supplied

Patterns

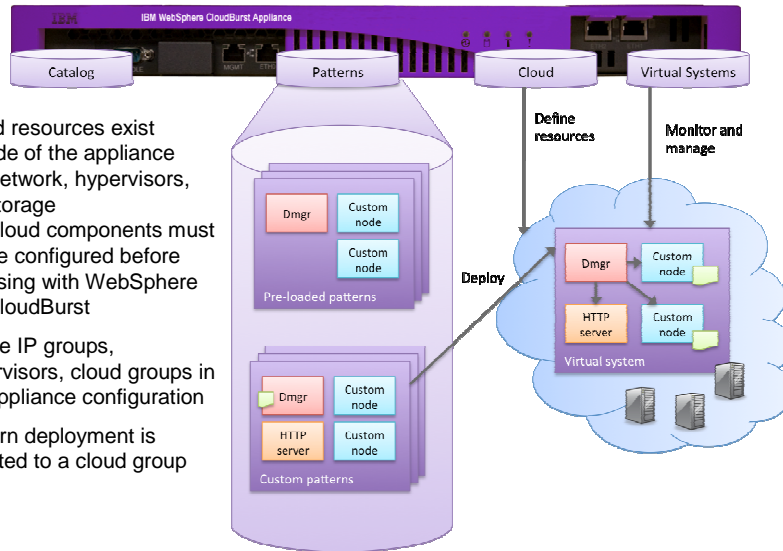

- Patterns describe the application server topology that gets deployed into the cloud
- A pattern is:
 - Based on a virtual image
 - Made up of virtual image parts and script packages
- Standard industry “best practices” patterns come preloaded on the appliance
- Use as-is or customize to suit your needs

WebSphere CloudBurst life cycle – dispense

Cloud resources

- Cloud resources exist outside of the appliance
 - Network, hypervisors, storage
 - Cloud components must be configured before using with WebSphere CloudBurst
- Define IP groups, hypervisors, cloud groups in the appliance configuration
- Pattern deployment is targeted to a cloud group

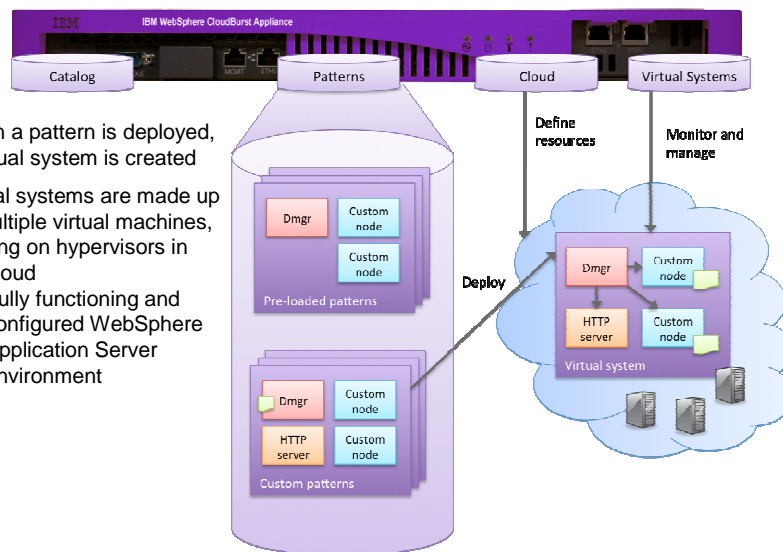

21

SHARE in Boston: IBM WebSphere CloudBurst Appliance

© 2010 IBM Corporation

Virtual systems

- When a pattern is deployed, a virtual system is created
- Virtual systems are made up of multiple virtual machines, running on hypervisors in the cloud
 - Fully functioning and configured WebSphere Application Server environment

22

SHARE in Boston: IBM WebSphere CloudBurst Appliance

WebSphere Application Server management

- Once deployed, WebSphere Application Server environments are managed and accessed in traditional ways
 - Administrators access the console
 - Clients access applications
- WebSphere CloudBurst provides access points for the deployed environment
 - WebSphere Application Server console
 - VNC
 - SSH

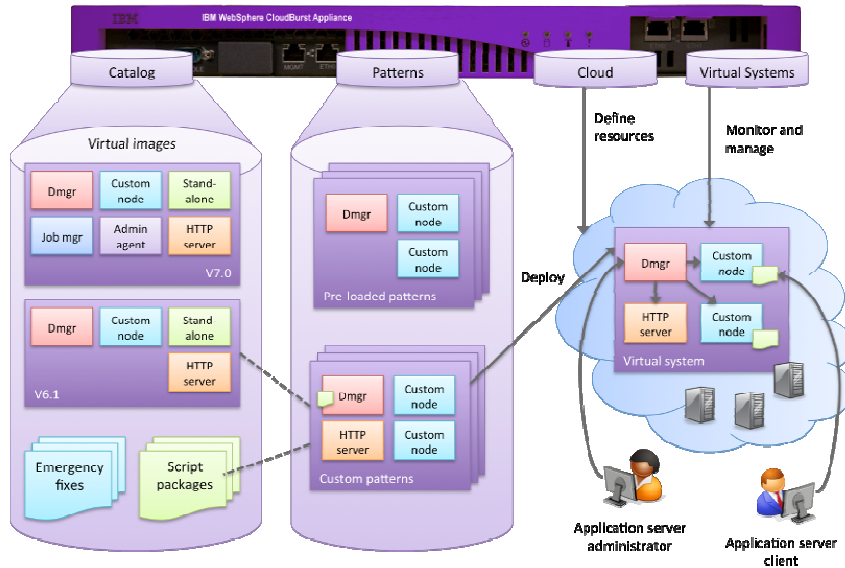

24

Section

Security, Users and Groups

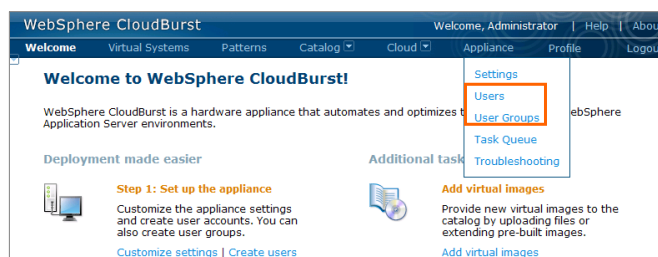

26

SHARE in Boston: IBM WebSphere CloudBurst Appliance

© 2010 IBM Corporation

Users and Groups - overview

- A user account allows an individual to access the IBM WebSphere CloudBurst Appliance
- The users feature of WebSphere CloudBurst allows you to define individual users in order to create new accounts
- The user groups feature of WebSphere CloudBurst allows you to group user accounts into logical sets
- Users and user groups are provided so that you can manage the permissions set for each individual for the IBM WebSphere CloudBurst Appliance
- User and Groups can be stored in the Appliance or can use a LDAP Server

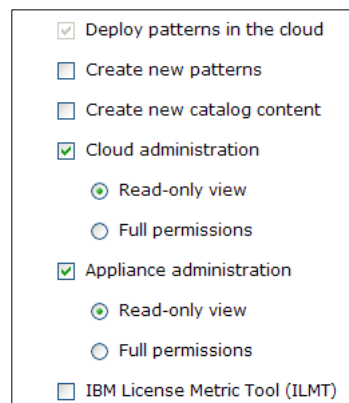

27

SHARE in Boston: IBM WebSphere CloudBurst Appliance

© 2010 IBM Corporation

User level operations

- The user panel under **Appliance > Users**
 - Displays user status icons and detailed user information
 - Can be used to create, modify and remove users
- User permissions can be specified from this page if the user is not a member of a user group
- If LDAP authentication is enabled, the user's password can not be set from the appliance

28

SHARE in Boston: IBM WebSphere CloudBurst Appliance

© 2010 IBM Corporation

Group level operations

- Group-level permissions
 - Set permissions for all group members at once
- Included user status icons on the group details page
 - Under **Appliance > User Groups > group_name**

Description:	non-admin users

Appliance security

- Contents of flash drive and hard disks are encrypted using key unique to the appliance
- Sensitive data such as passwords and encryption keys stored on internal flash drive inside tamper proof case
- Appliance provides no way for user to upload executable scripts or code outside of the script package mechanism
- System backup is encrypted
- Appliance contains no command shell

WebSphere Process Server Hypervisor Edition

IBM WebSphere Process Server Hypervisor Edition

- Preinstalled, configured, and tuned
- Open Virtualization Format standard packaging
- WebSphere Process Server V6.2 and V7.0
- Available as a stand-alone image, or with WebSphere CloudBurst

Using WebSphere Process Server and WebSphere CloudBurst

- WebSphere Process Server virtual image included with WebSphere CloudBurst 2.0
- Create WebSphere Process Server pattern
- Edit WebSphere Process Server pattern
- Specify deployment parameters
- Deploy WebSphere Process Server to virtual system
- Access WebSphere Process Server virtual system parts in their virtual machines

WPS HVE - Patterns

- WebSphere Process Server comes preconfigured with three patterns
 - Single Server for WebSphere Process Server
 - Simulated Scalable Environment for WebSphere Process Server
 - Scalable Environment for WebSphere Process Server
- Use pattern parts to create custom patterns

Patterns – Single server

- Uses the stand alone server part
- Deployed to one virtual machine

Stand Alone Profile

Single Java Virtual Machine (JVM)

Key

Patterns – Simulated Scalable Environment

- Uses the full function control node part
- Deployed to one virtual machine

Remote messaging, remote support Process Server deployment pattern

Single Virtual Machine (VM)

App Target Cluster

Support Cluster

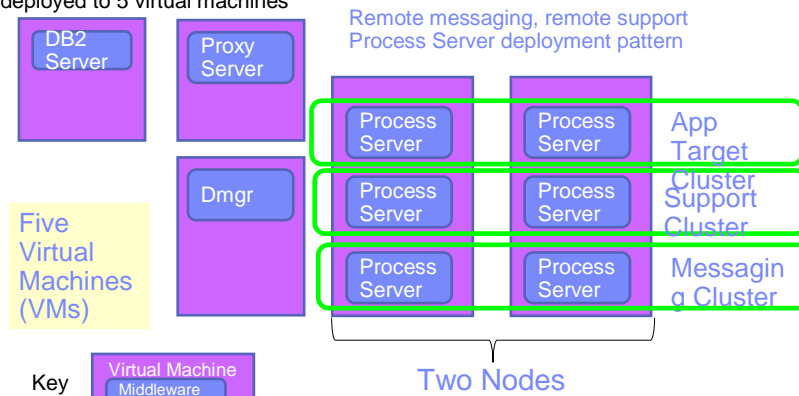

Messaging Cluster

Key

Patterns – Scalable Environment

- Uses the deployment manager, proxy server, database, full function control node and two basic function node parts
- deployed to 5 virtual machines

CloudBurst appliance management

- Administrative Web console
- Command Line Interface
- REST APIs to access the appliance

```

C:\cloudburst_c1\bin>cloudburst -h wsbeta161.austin.ibm.com -u admin -p admin
Welcome to the WebSphere CloudBurst Appliance CLI. Enter 'help' if you
need help getting started.
>>> help
The CloudBurst CLI provides an interpreted Jython scripting
environment that allows you to manage a WebSphere CloudBurst Appliance
from a remote machine.
The CloudBurst CLI assumes you have some familiarity with version
2.2.1 of the Python language. If not, there are many excellent
sources of information available in both printed form and on the web.
The CloudBurst CLI can run in both interactive and batch modes. For
more information on how to invoke the CLI, specify the --help
parameter to the cloudburst or cloudburst.bat command. When run in
interactive mode, the CloudBurst CLI supports command editing and
command history using both the arrow keys and a subset of the standard
emacs Unix shell key bindings.
In addition to the standard Jython libraries, the CloudBurst CLI
provides a rich set of functions and classes in the cloudburst package
to help you manage your WebSphere CloudBurst Appliance. More
extensive help is available for the cloudburst package by entering:
help(c.cloudburst)
>>>
  
```

Data center integration

- Points of integration into broader data center management solutions:
 - Automation / resource provisioning
 - License management
 - Monitoring
 - User management
 - Metering / billing

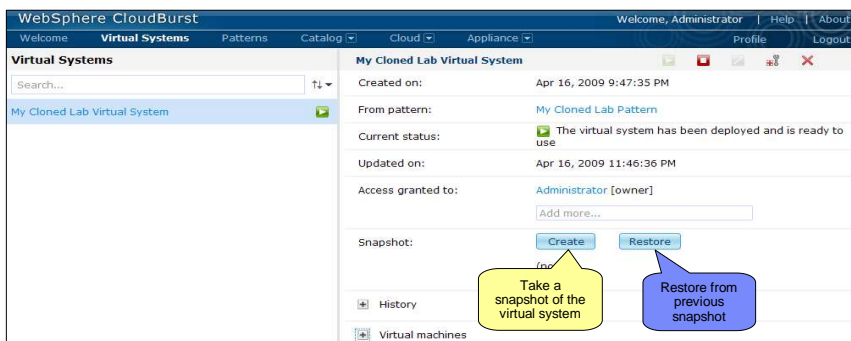

Section

Virtual system snapshot and restore

Virtual System Snapshot and Restore

- CloudBurst provides mechanism to snapshot and restore all the virtual images within a Virtual system
 - Useful to take snapshot of working system that can be restored later, if needed
- On Snapshot
 - CloudBurst calls out to the hypervisor to initiate a snapshot create command
 - Snapshot is created for all virtual images in a given Virtual system
 - Snapshot is stored on the hypervisors where the virtual images are located, and not on CloudBurst – Can have only 1 snapshot at any given time
- On Restore
 - CloudBurst calls out to the hypervisor to initiate a snapshot restore command
 - Virtual system must be restarted after restore

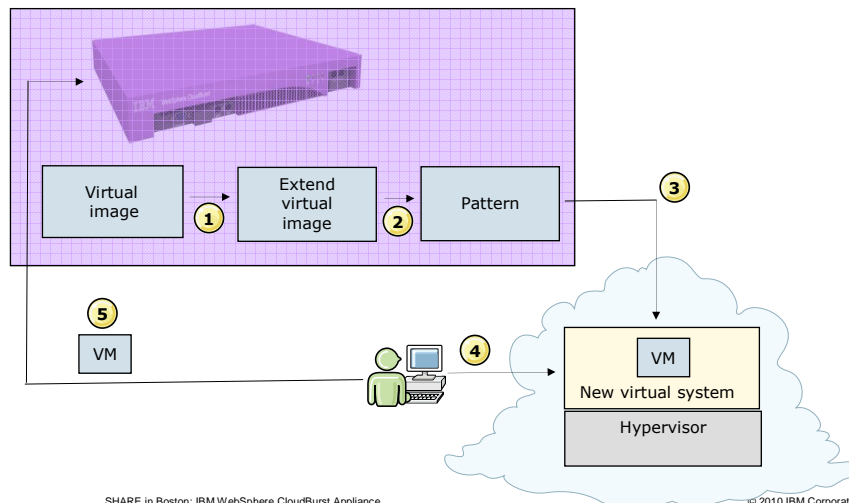

Section

Extending Virtual Image

Extend and capture process

- You can extend image to add maintenance files, add other products, etc.

Section

Applying Maintenance and Emergency Fixes to Virtual Image

Emergency fixes

- Emergency fixes
 - Fixes for Middleware - WebSphere Application Server, WebSphere Process Server ...
 - Fixes for virtual system binaries example: OS
- Types of emergency fixes
 - Service packs (provided by IBM)
 - iFixes (provided by IBM)
 - Generic fixes (packaged by end users)
- There are three approaches to apply fixes
 - Redeploy virtual systems with updated images
 - Recommended approach
 - IBM provides updated images in this case
 - Apply fix packs and emergency fixes directly to virtual system
 - Apply fixes directly to virtual systems without WebSphere CloudBurst
 - Not recommended, but possible using existing fix automation tools

Steps to Apply Maintenance

- Create a new Emergency fix – give a name, upload the file and
- Apply to the Virtual system
- Snapshot is created before fix is applied
- You can rollback the fix by restoring the snapshot
- Service history maintained

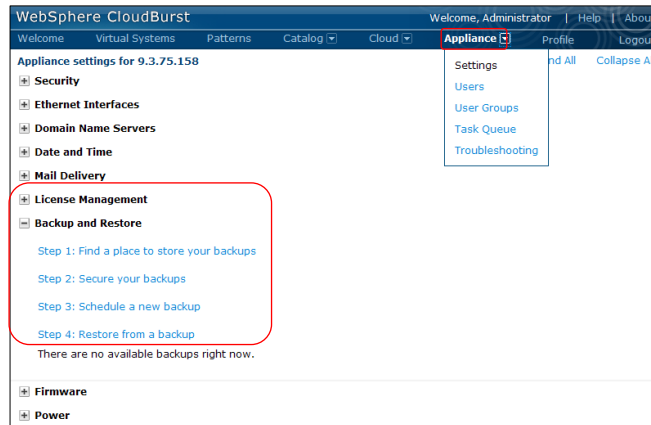

Section

Securely Backup and Restore Appliance configuration

Backup and restore

- Backup your appliance to a remote location securely
 - Can use your own certificate or have CloudBurst generate one
- Restore your appliance from a previous backup
- Can schedule backup and/or restore

Section

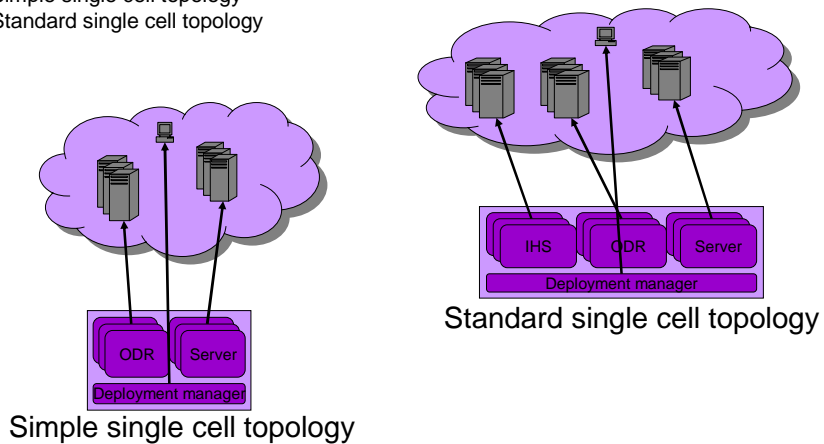

Intelligent management pack

Intelligent management pack

- Intelligent management pack feature set is similar to WebSphere Virtual Enterprise's feature set
- WebSphere CloudBurst Appliance benefits
 - Easily configurable WebSphere Application Server topologies with advanced functionality
 - Support "best practices" through pre-defined patterns and script packages
- Intelligent management pack benefits
 - JVM mobility through dynamic clusters
 - Apply maintenance with no loss of application service
- All integration features are supported on VMware, PowerVM™ and z/VM platforms

WebSphere Virtual Enterprise / patterns

- Two enhanced patterns come preloaded on the WebSphere CloudBurst Appliance
 - Simple single cell topology
 - Standard single cell topology

WebSphere Virtual Enterprise / advanced features

- WebSphere Virtual Enterprise configurable options integrated into the WebSphere CloudBurst Appliance
 - Health management
 - Overload protection
 - Dynamic clustering

Section

Dynamic virtual machine operations

Dynamic virtual machine operations

- What
 - Ability to add or remove virtual machines after deployment in order to handle varying workload
- Benefits
 - Gives you the flexibility to react to workload
 - Original pattern is preserved
 - No disruption to application availability or running virtual system
 - Can start or stop individual virtual machine
- How
 - Each virtual machine has Clone, Start, Stop and Delete operations
 - Clone adds a virtual machine for increased workload, whereas Delete removes the virtual machine for decreased workload
 - Any applicable script or maintenance packages are run at the time of the operation

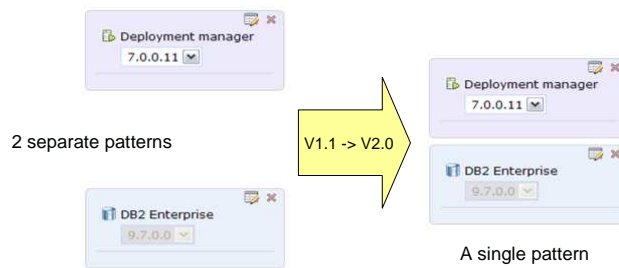

Section

Multi-image pattern composition

Multi-image composition

- Allows you to compose a single pattern that spans multiple IBM products and versions
- All virtual image parts making up a pattern must come from the same architecture (ESX, PowerVM or z/VM)

Section

License tracking and placement

License tracking and placement

- Manage virtual image licenses using the WebSphere CloudBurst Appliance to prevent exceeding license allotment
 - Configure the number of licenses per virtual image
 - Configure action to take when license usage has exceeded or is approaching allotment
 - Warn administrator if closing in on allotment
 - Allow deployment if allotment exceeded, but issue notification
 - Deny deployment if allotment exceeded
- Appliance maintains max usage logs which meet IBM license audit requirements
- License reporting can be done in the IBM License Metric Tool (ILMT)
- All license management features in appliance UI have been grouped together

Product	Product ID	Enforcement	Licenses owned (PVUs)	Notify if usage reaches	Licenses in use (PVUs)	Licenses reserved (PVUs)	In the cloud now
IBM WebSphere Application Server Hypervisor Edition	5724-X89	Ignore	0	90.0 %	0	0	0 virtual systems

Section

SNMP management

SNMP management

- Manage the WebSphere CloudBurst Appliance using the industry standard Simple Network Management Protocol (SNMP)
- Appliance can be monitored as part of the larger datacenter using products such as:
 - IBM Tivoli® Composite Application Manager (ITCAM)
 - IBM Director
 - HP OpenView
 - Any monitoring client that can consume MIB-II data

Section

Automate CloudBurst Pattern Customization with Rational Automation Framework for WebSphere (RAFW)

Automate Pattern Customization with Rational Automate for Agility

- ✓ Automating cloud development reduces time-to-market and delivers higher quality, consistent results
- ✓ Automate your existing tools and processes, gain rapid ROI, and then fine-tune your cloud development for increased efficiency and savings

Gain Control of WebSphere Environments

- ✓ Over 500 field-proven automated tasks for configuration and application deployment to Application Server and Portal Server targets

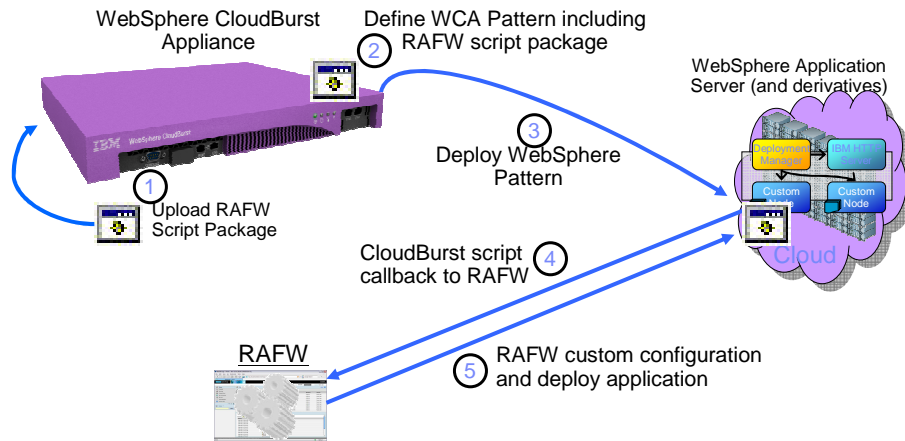

Head for the Clouds for Greater Resource Utilization

- ✓ Ensure efficient and consistent use of WebSphere CloudBurst images for many types of environments, including development, testing, and production scenarios
- ✓ Rational Automation Framework for WebSphere integration with WebSphere CloudBurst delivers on-demand, easily customized middleware appliances for all purposes

Configure WCA Pattern customized by RAFW

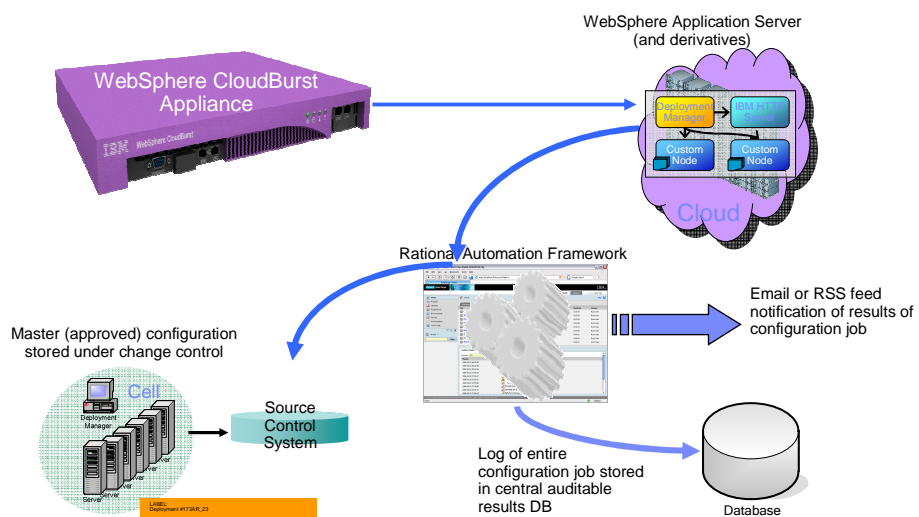

The screenshot shows the Rational Automate interface for configuring a pattern. On the left, a 'Zodiac Application Test Pattern' window is open, showing 'In the cloud now: (none)', 'Access granted to: Leigh [owner]', and 'Topology for this pattern:'. Below this, a 'Deployment manager' window shows a 'RAFW Deployment Plan' selected and circled in red. On the right, the main configuration window shows a list of required values for the pattern, including 'Verify password:', 'Password (virtuser):', 'RAFW_SERVER_HOST:', 'RAFW_SERVER_USER:', 'RAFW_SERVER_PASSWORD:', 'RAFW_AUTOMATION:', and 'RAFW_ENVIRONMENT:'. Each value has a corresponding input field. The 'OK' and 'Cancel' buttons are at the bottom right.

RAFW and WebSphere CloudBurst Appliance

Note: This scenario can be extended to include additional Rational components including Rational Asset Manager, Rational AppScan, and Rational Software Architect

Use RAFW to capture WCA configuration

Summary

Summary

- Life cycle support for
 - Virtualize
 - Dispense
 - Manage
- Delivered as a secure appliance
- Integrates into your enterprise

Business value: WebSphere CloudBurst increases efficiency, cost-effectiveness, and usability of WebSphere topologies in a data center by using cloud computing principles

U.S.A.

Performance is based on measurements and projections using standard IBM benchmarks in a controlled environment. All customer examples described are presented as illustrations of how those customers have used IBM products and the results they may have achieved. The actual throughput or performance that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput or performance improvements equivalent to the ratios stated here.
