WILLIAM DATA SYSTEMS

AGENDA . . . . . .

SHARE Technology · Connections · Results

- **Know Your Network**
- **Action Plans / Problem Determination**
- **Tools – General Usage**
- **Understanding the Common Tools**
  (ping, traceroute, netstat, nslookup, …)
- **Problem Diagnosis Tips**

WILLIAM DATA SYSTEMS

Know Your Network! . . .

SHARE Technology · Connections · Results

- In order to manage any network successfully, you must be aware of the topology.
- Before any successful, and timely, problem resolution can be attempted, a (current !) network diagram is ***essential***.
- The diagram (and associated documentation) should indicate all nodes and all possible paths, and detail the subnets, addresses and software (especially versions) available at each node.
- *Only then is it possible to create an appropriate* ***action plan****…*

WILLIAM DATA SYSTEMS

Action Plans . . . . .

SHARE Technology · Connections · Results

- **Where to Start?** - First, ***identify the problem***. This will determine the right tools to use, and the right place to start testing from (**! "Top-down" or "Bottom-up" !**). Progressive testing may be needed to isolate the problem area.

Misinformation Anecdote

- Network problems usually fall into two or three categories:-
  - **No connection can be made.**
  - **Connections can be made, but are unstable, OR , not all functions operate.**
  - **Connections are stable but performance is poor.**

SHARE in Orlando 2011

WILLIAM DATA SYSTEMS

Action Plans . . . . .

SHARE Technology · Connections · Results

Connectivity issues can be caused by:-

Application errors
Failed network connections
Bad configuration/changes
Hardware failures
Failed bind
Power failures
Security restrictions

Performance issues can be caused by:-

Insufficient bandwidth
Bottlenecks
Priorities
Retries
Broadcasts
Congestion
Routing
Fragmentation
Application errors
Switch faults

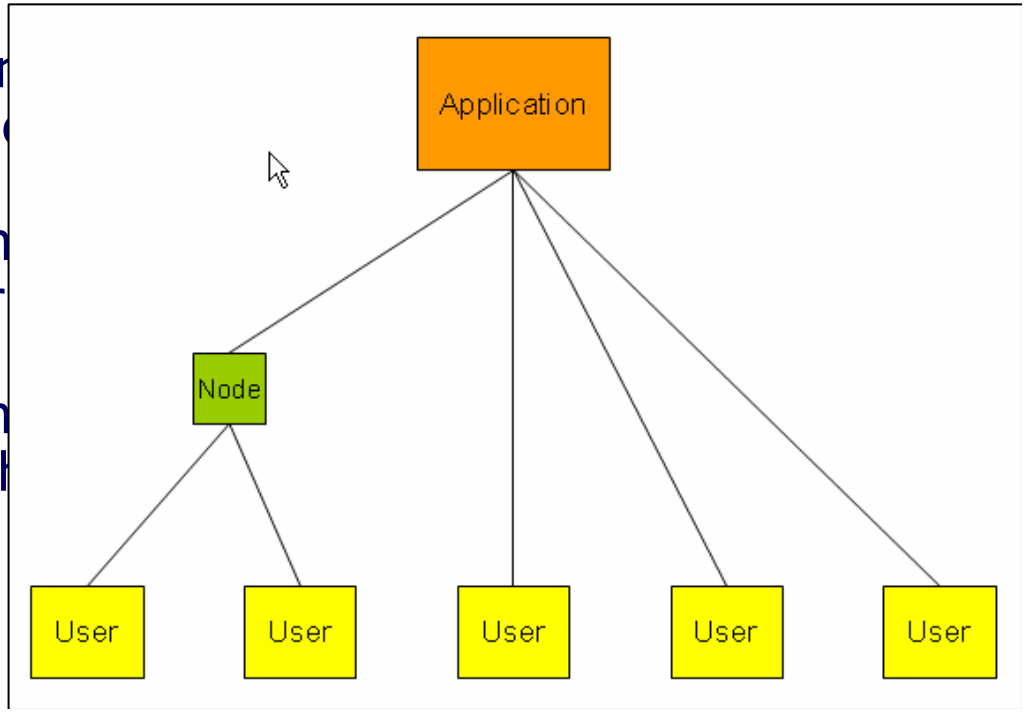
Action Plans . . . . .

1. **Investigate (*ALL*) error messages** – these may indicate the nature and location of the failure [**e.g.** "ttl" expired**,** no path available**,** packet size too large ("nofragment" is on)].

!! Syslogd !!

2. **Classify the error** – ask what works and what doesn't, and for whom . . .

- Problems affecting or
  physical (e.g. ch
- Problems affecting m
  to be the networ
- Problems affecting m
  one network path
  application.



Action Plans . . . . .

3. **Test connectivity** (***end-to-end***) – using Ping/Traceroute.
   Be careful to ensure that the packets take the same path as the problem connection (i.e. ensure correct source interface address – you may need to use an "extended" PING).

   - If PING fails, note the location and investigate there.
   - If PING succeeds (note that this is ICMP, the connection probably uses TCP, so this may *NOT* be a conclusive test), try with a TCP PING if available
   - If PING succeeds try again with larger packets, if appropriate.

WILLIAM DATA SYSTEMS

Action Plans . . . . .

SHARE Technology · Connections · Results

For Example: Problem reported as …

"end-user cannot connect to application"

- Starting at the end-user system ensure local physical connections are good, then check the next layer, such as local switch ports, vlans, routers, and even firewalls.
- Then, test each "hop" by progressive steps across the network.
- Then ensure that the system running the required application is connected at the network level ("ping" from that system outbound via the interface in question.

If all these results are good, then the issue is probably with the application and not a network problem!

WILLIAM DATA SYSTEMS

Tools . . . . .

SHARE Technology · Connections · Results

Disclaimer:

The fact that some tools are mentioned in this presentation while other tools are not, in no way implies recommendation of the tools mentioned, nor condemnation of those tools not mentioned.

The purpose of this presentation is simply to make attendees aware that such tools exist, and the attendees should make up their own mind as to the suitability of any tool used on their own system.

WILLIAM DATA SYSTEMS

"Common" Tools . . . . .

SHARE Technology · Connections · Results

"PING" - proves that connectivity exists

"TRACERTE" - discovers the network path (also "tracert")

"NETSTAT" - to locate connection information

```
ALL         - All connections to a stack
ALLConn     - TCP/IP connections
ARp         - Query ARP table or entry information
CONFIG      - Configuration data
COnn        - Active TCP/IP connections (Default)
DEvlinks    - Devices and links
Gate        - Current known gateways
HOme        - Home address list
PORTList    - Display port reservation list
ROUTe       - Display routing information
SOCKets     - Socket interface users and sockets
STATS       - TCP/IP statistics
TCP         - Displays detailed info about the stack
TELnet      - Telnet connection information
```

```
z/OS command format:
--------------------

NETSTAT < Option | Command > <
Target >
          < Output > < (Select >

E.g.:
TSO NETSTAT CONN (PORT 25
TSO NETSTAT TCP TCPIP
```

Note that "**NETSTAT .....(REPORT**" will collect the output to a dataset; for ease of reading or input to a REXX?

WILLIAM DATA SYSTEMS

Other Tools . . . . .

SHARE Technology · Connections · Results

"Nslookup" - test domain name resolution (& **"DIG"**)

"Snmp" - where SNMP is supported, there are many tools available to extract further information (MIB data), once the problem area has been located (e.g. Monitors, such as "**Implex**" for z/OS ; "**iReasoning**" elsewhere)

- - - - -

"TIVOLI" - IBM network tools (Monitor and trace facilities)

"Ctrace" - z/OS trace tool

"EXIGENCE" - WDS trace "expert" system
(now ZTS ! – "ZEN Trace & Solve")

SHARE in Orlando 2011

WILLIAM DATA SYSTEMS

Other Tools . . . . .

SHARE Technology · Connections · Results

"TPing" - ("TurboPing") "PING" using TCP packets

"Tcpdump" - (also Windump & SSLdump) is a packet sniffer found on many (most?) open platforms.

"Ethereal" - open system packet analyser (& **"Wireshark"**)

"Pchar" - is a reimplementation of Van Jacobson's ("Mr Traceroute") **pathchar** utility which analyses the individual hops of a path.

"Netcat" - Netcat is a utility which reads and writes data across network connections. It is a network debugging and exploration tool. (*+ port-scanner !*)

* New *
Ncat from Nmap

"VisualRoute" - path checker and graphical display

"NeoTrace" - (McAfee) Internet locator: enhanced traceroute

....etc

SHARE in Orlando 2011

Tools in Detail . . . . .

"Ping" - "**P**acket **IN**ternetwork **G**roper", is usually ICMP-based, which works if ICMP is allowed to pass. If not permitted, then an application-based ping can be used [e.g. "**APING**" (UDP) or "TPing" (TCP)].

Ping tests by sending out **ICMP Request** packets, and receiving **ICMP Replies**, therefore verifying up to (ISO) **layer 3** . . .

```
C:\>ping 66.249.85.99              ( www.google.co.uk ----- use IP address or URL )
Pinging 66.249.85.99 with 32 bytes of data:

Reply from 66.249.85.99: bytes=32 time=22ms TTL=244
Reply from 66.249.85.99: bytes=32 time=22ms TTL=244
Reply from 66.249.85.99: bytes=32 time=42ms TTL=244
Reply from 66.249.85.99: bytes=32 time=22ms TTL=244

Ping statistics for 66.249.85.99: Packets: Sent=4, Recvd=4, Lost=0 (0% loss),
Approx. round trip times in milliseconds: Min=22ms, Max=42ms, Ave=27ms
```

WILLIAM DATA SYSTEMS

Layers . . . . . .

SHARE Technology · Connections · Results

ISO 7-Layer Network Model

Layer 1: Physical - defines the real hardware.
Layer 2: Data Link - defines the format of data (frame/packet). (MAC)
Layer 3: Network - responsible for routing datagrams. (IP)
Layer 4: Transport - manages data between network and user. TCP/UDP)
Layer 5: Session - defines the format of the data sent.
Layer 6: Presentation - converts to/from local representation of data.
Layer 7: Application - provides network services to the end-users.

TCP/IP 4-Layer (Unix/DoD) Network Model

Layer 1: Link - defines the network hardware and device drivers.
Layer 2: Network - addressing, routing, delivery. (IP / ICMP) (ARP)
Layer 3: Transport - communication; end-to-end integrity. (TCP / UDP)
Layer 4: Application - user applications.
(DNS, arp, telnet, smtp, http, ftp, traceroute….)

ICMP Types/Codes . . . . .

ICMP Types:

0	Echo Reply
3	Destination Unreachable
4	Source Quench
5	Redirect
6	Alternate Host Address

Tools in Detail . . . . .

SHARE Technology · Connections · Results

PING (Windows)

Usage: **ping** [-t] [-a] [-n count] [-l size] [-f] [-i TTL] [-v TOS]
[-r count] [-s count] [[-j host-list] | [-k host-list]]
[-w timeout] target_name

Options:

-t		Ping the specified host until stopped. To see statistics and continue - type Control-Break; To stop - type Control-C.
-a		Resolve addresses to hostnames.
-n	count	Number of echo requests to send.
-l	size	Send buffer size.
-f		Set Don't Fragment flag in packet.
-I	TTL	Time To Live.
-v	TOS	Type Of Service.
-r	count	Record route for count hops.
-s	count	Timestamp for count hops.
-j	host-list	Loose source route along host-list.
-k	host-list	Strict source route along host-list.
-w	timeout	Timeout in milliseconds to wait for each reply.

WILLIAM DATA SYSTEMS

Tools in Detail . . . . .

SHARE Technology · Connections · Results

PING

```
C:\>ping 66.249.85.55     ← non-existent addresses
Pinging 66.249.85.55 with 32 bytes of data:

Request timed out.
Request timed out.          (or "Destination Unreachable ?)
Request timed out.          (if a return path is available)
Request timed out.

Ping statistics for 66.249.85.55: Packets: Sent=4, Recvd=0, Lost=4 (100% loss),
```

Drawbacks:

- Extra traffic on the network.
- "**Time To Live**" (**TTL**) set to a high value to ensure penetration.
- Network devices **may not allow** Ping/ICMP and may drop its priority.
- May not take the same path as user traffic; delay (latency) reported may ***not*** be representative for the application(s).
- Low feedback on fault and location.

WILLIAM DATA SYSTEMS

Tools in Detail . . . . .

SHARE Technology · Connections · Results

TRACEROUTE (Windows)

Usage: **tracert [-d] [-h maximum_hops] [-j host-list]**
[-w timeout] target_name

Options:

-d	**Do not resolve addresses to hostnames.**
-h maximum_hops	**Maximum number of hops to search for target.**
-j host-list	**Loose source route along host-list.**
-w timeout	**Wait timeout milliseconds for each reply.**

- Also uses ICMP ! (although some platforms use UDP)
- Good for spotting "loops" in the routing
- "**Time To Live**" (**TTL***) is incremented for each positive response.
- Each "hop" in the path is identified (Names may be resolved!).
- "Per hop" round-trip delays can be identified.
- **Drawbacks** are similar to those of "Ping".

(* = anti-looping function of TCP/IP)

Tools in Detail . . . . .

TRACEROUTE

```
C:\>tracert 66.249.85.55 ( www.google.co.uk ----- use IP address or URL )

Tracing route to 66.249.85.55 over a maximum of 30 hops

  1    1 ms    1 ms    1 ms  81.144.212.33
  2    7 ms    6 ms    6 ms  62.7.96.41
  3    6 ms    6 ms    6 ms  core2-gig2-1.kingston.ukcore.bt.net [194.72.3.2]
  4    7 ms    7 ms    7 ms  core2-pos7-3.ealing.ukcore.bt.net [62.6.201.42]
  5    7 ms    7 ms    7 ms  core2-pos10-0.redbus.ukcore.bt.net [194.74.65.202]
  6    8 ms    7 ms    8 ms  194.74.65.38
  7    7 ms    7 ms    7 ms  72.14.238.244
  8   16 ms   16 ms   16 ms  216.239.43.91
  9   22 ms   22 ms   22 ms  72.14.232.209
 10    *       *       *     Request timed out.
 11    *       *       *     Request timed out.
 12    *     etc,etc . . .                  <----- default maximum of 30
```

TRACEROUTE should be run in BOTH directions!!

Look for unsuitable (long) routes and high latency

WILLIAM DATA SYSTEMS

Tools in Detail . . . . .

SHARE Technology · Connections · Results

TRACEROUTE

Some platforms give status indicators…

!H - Host unreachable. (Destination Net unreachable) The router has no route to the target system.

!N - Network unreachable.

!P - Protocol unreachable.

!S - Source route failed. A router is blocking source-routed packets.

!F - Fragmentation needed. (Check the MTU configuration at the router).

!X - Communication administratively prohibited. Traceroute blocked!

TRACEROUTE can be enhanced by visualization, as is often seen in graphical traceroute tools : **such as . . .**

TraceRoute Tools . . . . . .

VisualRoute - 1

Report for www.google.co.uk [66.249.85.99]

Analysis

This trace was started on 08-Jan-2007 10:28:48. The host 'www.google.co.uk' (known as ff-in-f99.google.com) has been found, and is reachable in 10 hops. Also, it responded to HTTP requests on port 80 (it is running server GWS/2.1, which responded in 431ms). The TTL value of packets received from it is 246.
In general this route offers a good throughput, with hops responding on average within 11ms. The DNS lookup was completed almost instantaneously (less than 2ms - this may be the result of caching).

TRACEROUTE –Alternatives

Where the target system is external to the local network, and especially where routing is not available to/from the local network, there are several sites around the World that offer the ability to run "Ping" and "Traceroute" to be instigated by remote control from their web site.

Basically, this is a "proxy" service ; the remote site issuing the test on your behalf.

This is suitable for determining the general availability of the target system (i.e. from anywhere on the Internet), but does not test specific routes.

"**www.samspade.org**" used to be an excellent example of this type of service, but is not currently available in its previous form.

Further directions to such services can be found at :-

"**www.traceroute.org**"

Tools in Detail . . . . .

NETSTAT(z/OS)

NETSTAT < Option | Command > < Target >
< Output > < (Select >

TSO NETSTAT CONN
TSO NETSTAT DEV
TSO NETSTAT TCP TCPIP
TSO NETSTAT SOCK
TSO NETSTAT ROUTE

Also "onetstat"…

Can be issued from either TSO or USS ; the results are the same.

NB. Netstat options will vary depending upon the platform!

Note the following examples from z/OS and Windows. . .

Tools in Detail . . . . .

NETSTAT(z/OS) –"DEV"

DNS . . .

In general, it is quite common to seek an IP target using a URL (which acts rather like a PATH name**).**

This entails sending the URL to a "Domain Name Server" (or "Resolver") in z/OS terms) to have the name translated (i.e. a "table lookup") into an IP address (*this may occur locally by use of the "Hos*

The IP address returned is then used to

- -

```
** HOSTS file from Windows :-
( C:\WINDOWS\system32\drivers\etc )

127.0.0.1       localhost
192.168.1.45    lizzie
192.168.1.45    wds.local
192.168.1.45    wds
192.168.1.43    wdsnfs
```

This process may also be performed in reverse; i.e. the DNS server can translate an IP address into a URL !

The use of a URL means that remote services can be failed-over, relocated or rebuilt without the users needing to know!

WILLIAM DATA SYSTEMS

Tools in Detail . . . . .

SHARE Technology · Connections · Results

DNS . . .

The global Domain Name System is a hierarchy of servers/services spread across the Internet. At its core is a set of servers that manage the base domains; such as "com", "edu", "gov" ...etc

When a name is "looked up" it happens from right to left - *recursively*.

Take www.google.co.uk ...

- **First the server is located that controls the "uk" domain (**there is an implied "root" service where all top-level servers are known**).**
- **This will indicate the "co.uk" server ; which in turn will indicate the "google.co.uk" server.**
- **The "google.co.uk" server will have IP addresses (*an "A" record*) for web ("www") and mail services (**note: "www" is not the only canonical form used!**)**

NAMED.CONF - lists the "zones" (eg. "google.co.uk")

ZONE FILES - hold the IP addresses

NB. Zone information changed at the bottom of a "layer" is propagated upwards by "Zone Transfer" at preset times.

Tools in Detail . . . . .

NSLOOKUP (Windows)

Usage: **nslookup** **NAME** , or , **NAME1 NAME2** ←(cf z/OS "Resolver")
or ***command***

set *option*

all	[no]debug	[no]d2	[no]defname
[no]recurse	[no]search	[no]vc	domain=NAME
srchlist=N1[/N2/.../N6]		root=NAME	retry=x
timeout=X	type=X	querytype=X	class=X
[no]msxfr	ixfrver=X		

Server NAME

Exit

"Lookup" failure will cause connectivity failure, and symptoms can be mistaken for a routing problem!

- - - -

z/OS often acts as a relay, passing the requests on to a network DNS server.

Tools in Detail . . . . .

NSLOOKUP (Windows)

```

Tools in Detail . . . . .

Pchar

Estimates bandwidth, latency and packet loss on network links.

This is a re-working of the "pathchar" utility, written by Van Jacobson and, like traceroute, is based on repeated packet transmission and TTL variation (it can use ICMP or UDP).

It is available for most "***nix**" systems : It works for IPv4 & IPv6.

Traceroute (UDP) knows when it has found its target by using a port number beyond the "normal range"… when ICMP "port unreachable" is returned it's there!

Pchar sends many packets, one hop at a time, with varying the sizes, until the target is reached or the path fails. It calculates the latency from the ICMP message response times, and the throughput per hop from the variance in response speeds. Collectively, this also gives the overall round-trip delay for the whole path.

It is not fool-proof ; it's traffic may ***not*** be allowed ; it is not a "Holy Grail" ; but it does give a good indication!

Tools in Detail . . . . .

Pchar - ./pchar www.google.co.uk

```
pchar to www.l.google.com (66.249.93.104) using UDP/IPv4
Using raw socket input
Packet size increments from 32 to 1500 by 32
46 test(s) per repetition : 32 repetition(s) per hop
Warning: target host did not respond to initial test.
 0: 192.168.1.231 (dhcp-192-168-1-231.uk.willdata.com)
    Partial loss:      0 / 1472 (0%)
    Partial char:      rtt = 0.959029 ms, (b = 0.001150 ms/B), r2 = 0.999475
                       stddev rtt = 0.003212, stddev b = 0.000004
    Partial queueing:  avg = 0.000171 ms (148 bytes)
    Hop char:          rtt = 0.959029 ms, bw = 6954.330709 Kbps
    Hop queueing:      avg = 0.000171 ms (148 bytes)
 1: 81.144.212.33 (81.144.212.33)
    Partial loss:      0 / 1472 (0%)
    Partial char:      rtt = 5.784087 ms, (b = 0.005317 ms/B), r2 = 0.999798
                       stddev rtt = 0.009218, stddev b = 0.000011
    Partial queueing:  avg = 0.002336 ms (667 bytes)
    Hop char:          rtt = 4.825058 ms, bw = 1919.855256 Kbps
    Hop queueing:      avg = 0.002165 ms (519 bytes)
 2: 62.7.96.41 (62.7.96.41)
    Partial loss:      0 / 1472 (0%)
    Partial char:      rtt = 5.824306 ms, (b = 0.005317 ms/B), r2 = 0.999847
                       stddev rtt = 0.008008, stddev b = 0.000010
    Partial queueing:  avg = 0.001486 ms (667 bytes)
    Hop char:          rtt = 0.040220 ms, bw = --.--- Kbps
    Hop queueing:      avg = -0.000850 ms (0 bytes)
 3: 194.72.3.66 (core2-gig10-1.kingston.ukcore.bt.net)
                       ???                          -          process hangs at this point!
```

This example shows a "pchar" test across a path where icmp responses are ***not*** allowed.

Tools in Detail . . . . .

Pchar - ./pchar 192.168.1.8 (a local address)

```
pchar to 192.168.1.8 (192.168.1.8) using UDP/IPv4
Using raw socket input
Packet size increments from 32 to 1500 by 32
46 test(s) per repetition : 32 repetition(s) per hop

 0: 192.168.1.231 (dhcp-192-168-1-231.uk.willdata.com)

    Partial loss:      0 / 1472 (0%)
    Partial char:      rtt = 10.792415 ms, (b = 0.003369 ms/B), r2 = 0.157013
                       stddev rtt = 0.950840, stddev b = 0.001177
    Partial queueing:  avg = 0.015037 ms (4463 bytes)
    Hop char:          rtt = 10.792415 ms, bw = 2374.706954 Kbps
    Hop queueing:      avg = 0.015037 ms (4463 bytes)
 1: 192.168.1.8 (zplex.uk.willdata.com)

    Path length:       1 hops
    Path char:         rtt = 10.792415 ms r2 = 0.157013
    Path bottleneck:   2374.706954 Kbps
    Path pipe:         3203 bytes
    Path queueing:     average = 0.0150
    Start time:        Thu Feb  1 09:07
    End time:          Thu Feb  1 09:14
```

```
Partial loss      = number of pkts / percentage pkts lost
Partial  char     = RTT, delay Byte, min delay pkt
Partial queueing  = ave. queue of data incl. of this hop
Hop char          = RTT and b/width for the current hop
Hop queueing      = average queue of data this hop

Path bottleneck   = "bottleneck" (achieved) bandwidth
Path pipe         = Bandwidth-Delay Product = traffic
                    "on the wire" (cf RWIN buffer)
```

Tools in Detail . . . . .

Pchar

Remember:

ICMP may be restricted over the test path

Not all platforms have the same controls or defaults

Think of the impact on the network of using these kind of tools!!

The figures produced are estimates (ref. pchar "man pages" of pchar and, as already mentioned for some previous tools, the results will probably not reflect the exact behaviour of the applications using the same path.

Netcat

Netcat - a read/write utility for networks (TCP or UDP).
It can be used on its own or be driven by user code.
It is also a very powerful network debugging and exploration tool, which can create almost any kind of connection:-

- Outbound or inbound, TCP or UDP, to or from any ports
- Full DNS forward/reverse checking, with appropriate warnings
- Ability to use any local source port
- Ability to use any locally-configured network source address
- Built-in port-scanning capabilities, with randomizer
- Can read command line arguments from standard input
- Slow-send mode, one line every N seconds
- Hex dump of transmitted and received data
- Ability to let another program service established connections
- Telnet-options responder

Good for testing applications and application paths, but does not "test" or measure the network itself.
Beware of misuse!

Tools in Detail . . . . .

Netcat

```
connect to somewhere:   nc [-options] hostname port[s] [ports] ...
listen for inbound:     nc -l -p port [options] [hostname] [port]
options:
        -d              detach from console, background mode

        -e prog         inbound program to exec [dangerous!!]
        -g gateway      source-routing hop point[s], up to 8
        -G num          source-routing pointer: 4, 8, 12, ...
        -h              this help
        -i secs         delay interval for lines sent, ports scanned
        -l              listen mode, for inbound connects
        -L              listen harder, re-listen on socket close
        -n              numeric-only IP addresses, no DNS
        -o file         hex dump of traffic
        -p port         local port number
        -r              randomize local and remote ports
        -s addr         local source address
        -t              answer TELNET negotiation
        -u              UDP mode
        -v              verbose [use twice to be more verbose]
        -w secs         timeout for
        -z              zero-I/O mod
port numbers can be individual or ra

Network & Security testers

"Nessus" **-** ("**The Tenable Newt**") a security vulnerablility scanner.
(www.nessus.org)

"Nmap" - a network and security scanner
(insecure.org & nmap.org)

Use responsibly – Use with care !

SHARE in Orlando 2011

Tools in Detail . . . . .

Nmap (edited)

```
>nmap -v -A 192.168.27.50
Starting Nmap 4.20 ( http://insecure.org ) at 2007-02-03 11:40 GMT Standard Time
Initiating ARP Ping Scan at 11:40
Scanning 192.168.27.50 [1 port]
Completed ARP Ping Scan at 11:40, 0.20s elapsed (1 total hosts)
Initiating Parallel DNS resolution of 1 host. at 11:40
Completed Parallel DNS resolution of 1 host. at 11:40, 0.03s elapsed
Initiating SYN Stealth Scan at 11:40 : Scanning 192.168.27.50 [1697 ports]
Discovered open port 135/tcp on 192.168.27.50
Completed SYN Stealth Scan at 11:40, 39.05s elapsed (1697 total ports)
Initiating Service scan at 11:40 : Scanning 1 service on 192.168.27.50
Completed Service scan at 11:41, 11.63s elapsed (1 service on 1 host)
Warning:  OS detection for 192.168.27.50 will be MUCH less reliable because we did not
find at least 1 open and 1 closed TCP port
. . .
Host 192.168.27.50 appears to be up ... good.
Interesting ports on 192.168.27.50:
Not shown: 1696 filtered ports
PORT    STATE SERVICE VERSION
135/tcp open  msrpc   Microsoft Windows RPC
MAC Address: xx:xx:xx:xx:xx:xx (Dell ESG Pcba Test)
Running (JUST GUESSING) : Microsoft Windows 2000|XP (98%)
No exact OS matches for host (test conditions non-ideal).
Network Distance: 1 hop : TCP Sequence Prediction: Difficulty=0 (Trivial joke)
. . .
OS and Service detection performed. Nmap finished: 1 IP address (1 host up) scanned in
67.000 seconds
                Raw packets sent: 3517 (162.066KB) | Rcvd: 86 (4770B)
```

(NB. This sample has been edited to fit !)

WILLIAM DATA SYSTEMS

Problem Diagnosis . . .

SHARE Technology · Connections · Results

Outline Steps:

- Check the stack – "**ping**" local loopback
- "**ping**" the remote host/server name
- "**ping**" with IPaddress – the DNS may be down
- If "ping" fails "**traceroute**" - find where it stops
- Use "**netstat**" to check the interface
- Check routing (is it as expected?)
- If ping works, try "**telnet**" (standard port 23)
- If "**telnet**" works try **telnet to the application port**
- If that works try the application
- Use "**netstat**" to check the connection exists
- Check your syslogs (remember USS ! "syslogd" !)
- Do you ***still*** have a failure? … **trace it!**
