## Notes:

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

IBM hardware products are manufactured from new parts, or new and serviceable used parts. Regardless, our warranty terms apply.

All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.

This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.

All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.

# Agenda

- CSI Training
- The Crime is committed
- Collecting the Clues
- Analyzing the Crime Scene
- Back in the Lab
- Forcing LE to Spill the Beans
- Sources of Additional Information
- Appendix
  - Programs
  - Really Cool Lab Equipment

# CSI training

# Major clues to look for (ABENDs)

- U4038      A severe (unhandled) error occurred.
- U4039      A severe (unhandled) error occurred  
                  AND LE took a system dump.
  
- U4083      Save area back chain error
- U4087      Error during condition processing
- U4093      Error during initialization
- U4094      Error during termination

# Major clues to look for (ABENDs)

- U4038/U4039
  - A severity 2 or greater condition has gone unhandled
  - Application will terminate (gracefully)
  - Clues will be gathered and collected if requested
    - TERMTHDACT controls amount and type of clues
    - CEEDUMP and/or DYNDUMP can be collected

# Major clues to look for (ABENDs)

- U40xx
  - Application will terminate immediately
  - TERMTHDACT does NOT control what clues are gathered
  - No CEDUMP is generated
  - DYNDUMP can be used (3<sup>rd</sup> suboption) to collect clues

# Major clues to look for (messages)

- Message (and module) prefixes
  - CEE CEL (but may be reporting errors elsewhere)
  - IGZ COBOL
  - IBM PL/I
  - FOR Fortran (also AFH)
  - EDC C/C++

See z/OS Language Environment Run-Time Messages

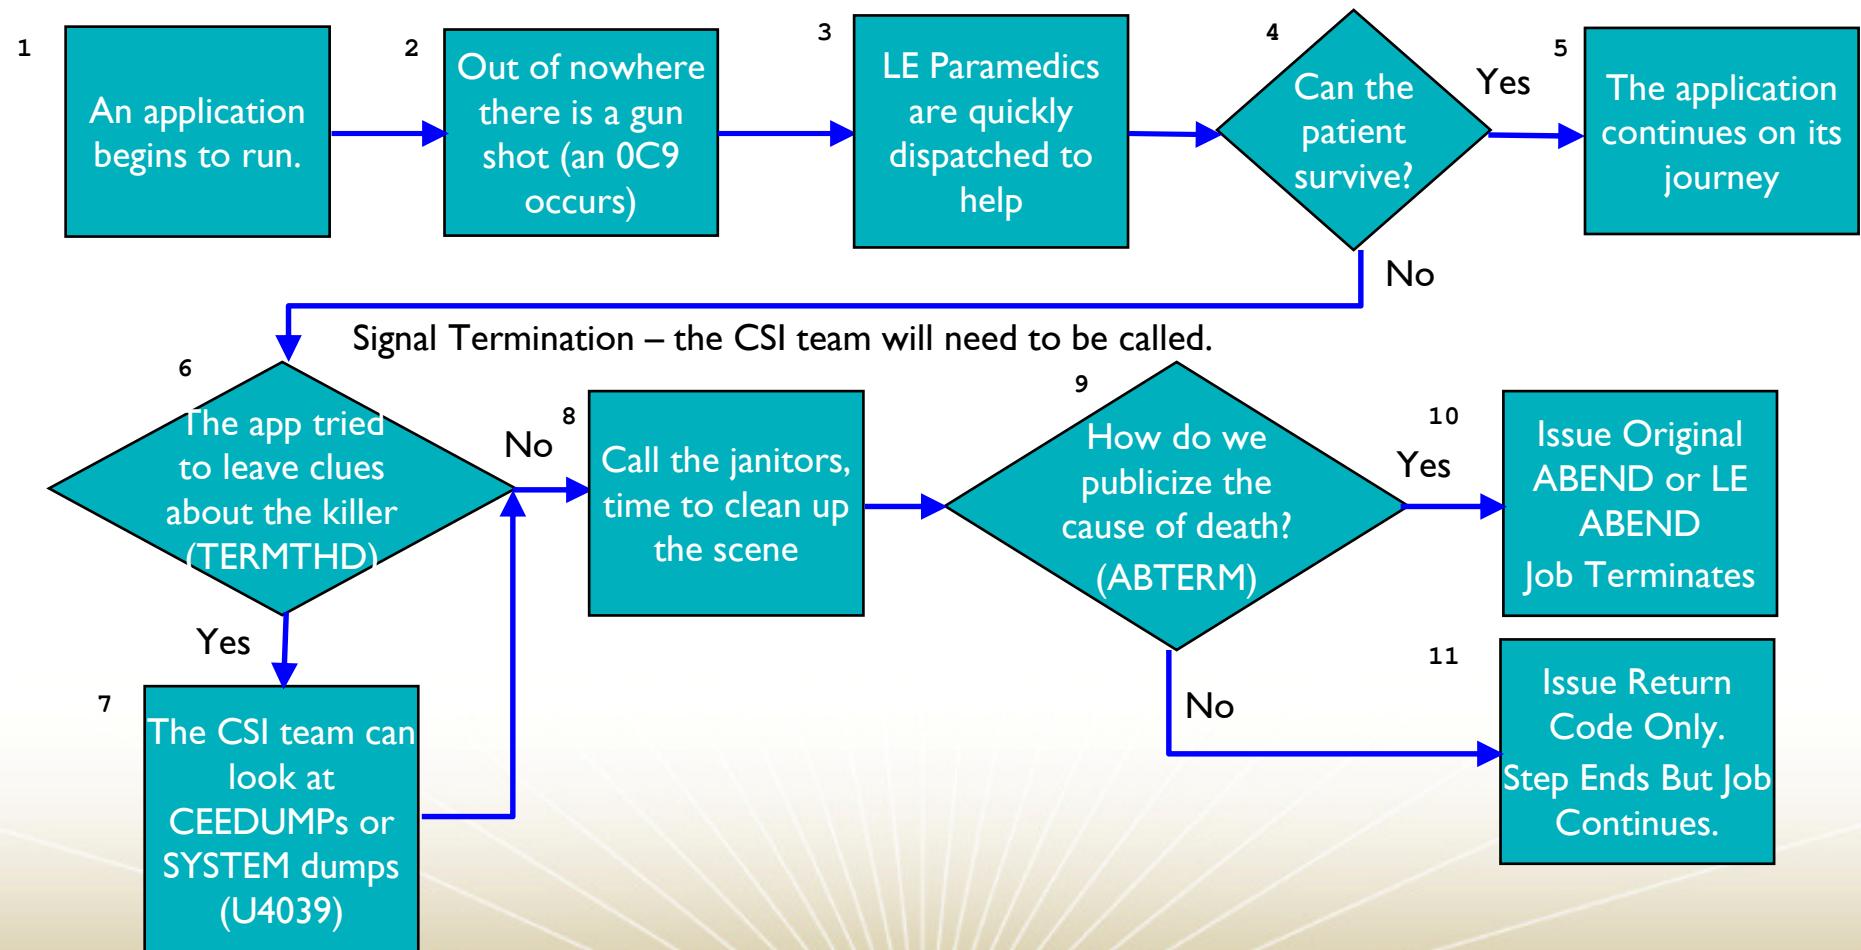

# Some DNA mapping

- Condition Token (Feedback Code)
  - Example: 00030C89 59C3C5C5 xxxxxxxx
    - 0003 | 0C89 | 59 | C3C5C5 | xxxxxxxx
      - 0003              Severity
      - 0000              Informational (I)
      - 0001              Warning (W)
    - 0002              Error (E)
    - 0003              Severe (S)
    - 0004              Critical (C)

# Some DNA mapping

- Condition Token (Feedback Code)
  - Example: 00030C89 59C3C5C5 xxxxxxxx
    - 0003 | 0C89 | 59 | C3C5C5 | xxxxxxxx
      - 0003 Severity (**S**)
      - 0C89 Hex message number (**3209**)
      - 59 Flags (ignore)
      - C3C5C5 Hex (EBCDIC) facility ID (message prefix) (**CEE**)
      - xxxxxxxx Instance specific info (internal)
    - This token represents message CEE3209S

# Timeline of a crime

# The crime is committed

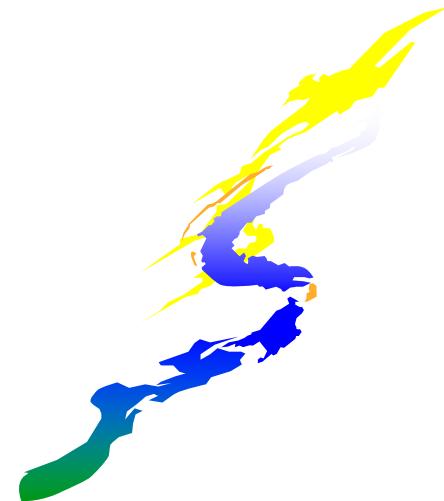

# The criminal application is written

- A COBOL program (COBOLED1) calls
- A 2<sup>nd</sup> COBOL program (COBOLED2) which calls
- A C program (CPROG3)
- CPROG3 divides by zero!

See appendix for these programs

# Collecting the clues

# Major Sources of Evidence

- CEDUMP
- LEDATA IPCS Verb Exit
- Other Language Environment-produced reports
  - Options Report
  - Storage Report
  - Heap Storage Diagnostics Report

# Major Sources of Evidence

- Getting useful information
  - Use Language Environment run-time option TERMTHDACT() to request Language Environment take a dump
    - DUMP CEEDUMP with storage
    - TRACE CEEDUMP with traceback only
    - **UADUMP** **CEEDUMP, system dump via U4039**
    - UAONLY No CEEDUMP, system dump via U4039
    - UATRACE CEEDUMP (traceback) and system dump via U4039
  - **(UAIMM)** *System dump via original error (only for debug purposes), also TRAP(ON,NOSPIE)*

# CEEDUMP (the picture)

- Formatted dump produced by Language Environment
  - Failure information, traceback, control blocks, heaps, run-time options report
- Written to CEEDUMP data set:
  - CEEDUMP DD if allocated
  - Dynamically allocated if not available based on CEEDUMP run-time option
    - CEEDUMP(60,SYSOUT=\*,FREE=END,SPIN=UNALLOC)
- CICS written to CESE Transient Data Queue
  - With TERMTHDACT(,CICSDDS) written as part of the CICS dump data set (CICS transaction dump)

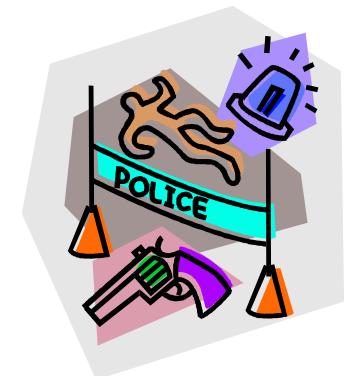

# CEEDUMP (the picture)

- Advantages
  - Immediately available and readable
  - Can provide a lot of information (with the right set of compile and run-time options)
- Disadvantages
  - Snapshot of the crime scene
    - May not contain all clues necessary to solve the crime

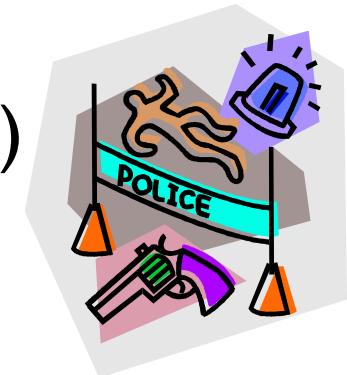

# IPCS readable dump (the body)

- IPCS support to format and analyze data in a system dump
- Options to generate numerous reports
  - CEDUMP information and more
- System dump generated:
  - For an unhandled condition of severity 2 or greater
    - TERMTHDACT(UADUMP/UATRACE/UAONLY)
      - with SYSMDUMP DD
      - DYNDUMP(hlq,DYNAMIC,TDUMP)
    - When CEE3ABD is called by the application
    - Using system mechanisms (SLIP, Console Dump)

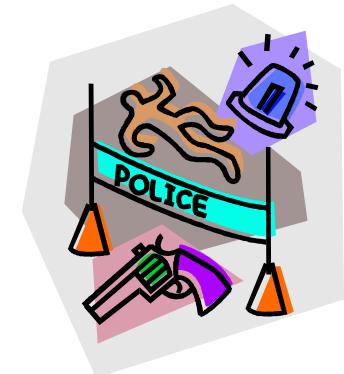

# IPCS readable dump (the body)

- DYNDUMP run-time option
  - DYNDUMP(hlq,U4039-ABEND,U40xx-ABEND)
    - hlq
      - \*USERID or \*USERID.hlq
      - \*TSOPREFIX or \*TSOPRE
        - (also \*TSOPREFIX.hlq or \*TSOPRE.hlq)
      - Up to 26 characters of an MVS data set name

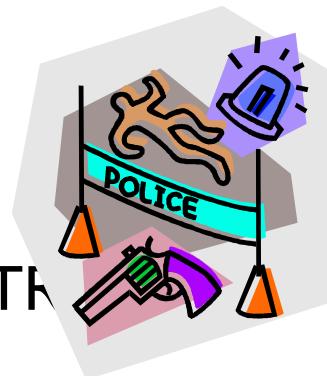

# IPCS readable dump (the body)

- DYNDUMP run-time option
  - DYNDUMP(hlq,U4039-ABEND,U40xx-ABEND)
    - U4039-ABEND
      - NODYNAMIC (default)
        - DYNDUMP turned off for U4039 ABENDs
      - DYNAMIC
        - DYNDUMP active for U4039 ABENDs if no SYMDUMP, SYSUDUMP or SYSABEND DD.
      - FORCE
        - DYNDUMP active for U4039 ABENDs even with above DDs allocated
      - BOTH
        - You want it all!!!

# IPCS readable dump (the body)

- DYNDUMP run-time option
  - DYNDUMP(hlq,U4039-ABEND,U40xx-ABEND)
    - U4039-ABEND
      - TERMTHDACT MUST be set to UADUMP, UATR or UAONLY to generate a U4039.
      - U4038 does not produce a dump!
      - Example: DYNDUMP(JMONTI,FORCE,TDUMP)

+CEE3798I ATTEMPTING TO TAKE A DUMP FOR ABEND U4039 TO DATA SET:  
JMONTI.D201.T1336225.JMONTI@B

IEA822I COMPLETE TRANSACTION DUMP WRITTEN TO  
JMONTI.D201.T1336225.JMONTI@B

+CEE3797I LANGUAGE ENVIRONMENT HAS DYNAMICALLY CREATED A DUMP.

# IPCS readable dump (the body)

- DYNDUMP run-time option
  - DYNDUMP(hlq,U4039-ABEND,U40xx-ABEND)
    - U40xx-ABEND
      - TDUMP (Default)
        - DYNDUMP is active for all U40xx ABENDs (other than U4039) which request a dump.
      - NoTDUMP
        - DYNDUMP is not active for U40xx ABENDs

# IPCS readable dump (the body)

- DYNDUMP run-time option
  - Not honored for CICS
  - Use CEMT to request system dumps in CICS
    - CEMT SET TRD(40xx) SYS ADD

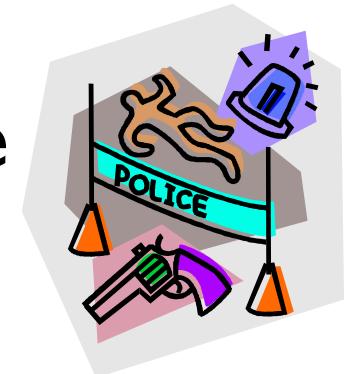

# IPCS readable dump (the body)

- Advantages

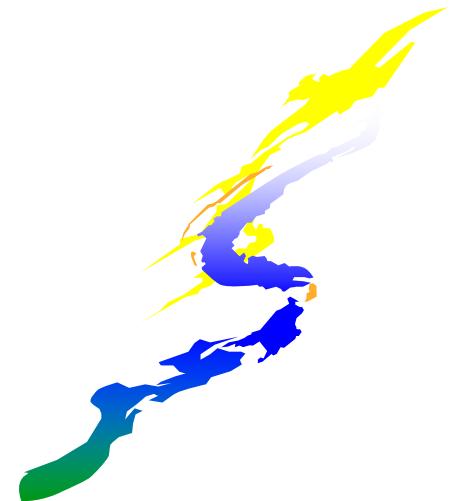

- More complete picture of the crime scene
- IPCS tools available for debugging

- Disadvantages

- Additional skills required for analysis
- Application programmers may not have access to system dumps and/or IPCS
- Sometimes have to get your hands dirty (with bits and bytes)

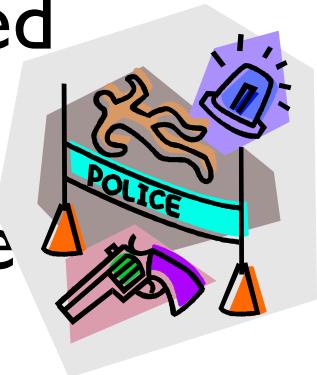

# False Leads!

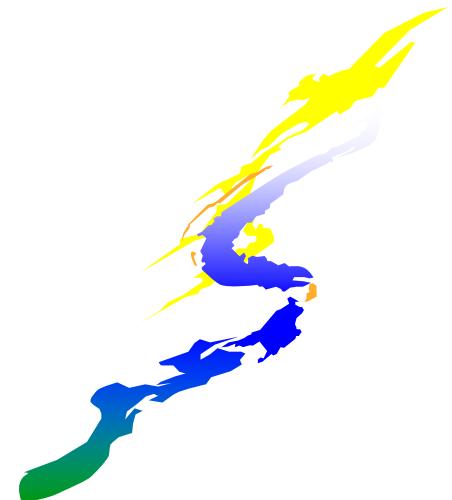

# Don't be fooled!

- Don't SLIP on Language Environment reissued ABEND (eg, 0C4)
  - Remember this is taking a picture after the crime scene has been cleaned up!

# Analyzing the Crime Scene

# Messages are the first clue

- Examine the Language Environment message file (usually SYSOUT)

CEE3209S The system detected a fixed-point divide exception (System Completion Code=0C9).

From compile unit POSIX.RTL.UT29.SRC(CPROG3) at entry point CPROG3 at statement 8 at compile unit offset +0000008C at entry offset +0000008C at address 219C60FC.

- Message tells us what the crime was and where it was committed!
  - A divide by zero occurred at offset x'8C' in CPROG3 (statement 8)!

# Back in the lab

# Who Took the Wild Branch...

## The Clue: The Breaking Event Address

- Available on z/Architecture machines with PER-3 facility
- 64-bit CPU register that is updated with the address of any instruction that causes a break in sequential instruction execution
- BEA register contents saved when interrupt occurs
- BEA value saved in SDWABEA
- LE uses SDWABEA to identify possible wild branch location
  - LE may also attempt to use linkage register (i.e., R14)

# Who Took the Wild Branch...

# Forcing LE to Spill the Beans

# Coercing Evidence from C-RTL

`perror()`: Prints string with errno message to stderr

`strerror()`: Returns message string for a given  
errno value

Environment variables to tell these functions to  
provide more information

- `_EDC_ERRNO_DIAG`
- `_EDC_ADD_ERRNO2`

# Coercing Evidence from C-RTL...

**\_EDC\_ERRNO\_DIAG = “x,y”**

**x**

- 0: Do not generate additional diagnostic information (default)
- 1: Call ctrace() – writes a traceback to CEEDUMP
- 2: Call csnap() – writes a condensed dump to CEEDUMP
- 3: Call cdump() – writes a CEEDUMP; sends snap dump to CEESNAP

**y**

- List of errnos for which action “x” is to be taken, separated by commas
- If not specified, defaults to all errno values

# Coercing Evidence from C-RTL...

## \_EDC\_ADD\_ERRNO2

- Tells perror() and strerror() whether to append errno2 information to their output
- For strerror(121):
  - \_EDC\_ADD\_ERRNO2 = “0” or unset:  
EDC5121I Invalid argument
  - With \_EDC\_ADD\_ERRNO2 = “1”:  
EDC5121I Invalid argument. (errno2=0x0C0F8402)
- Default perror() behavior for z/OS V1.9 is to include errno2 value

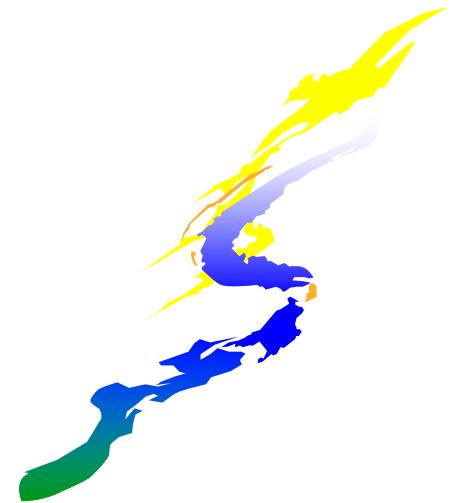

### Interpret errno2 value using:

- BPXMTXT TSO command (handles both USS and LE errno2 values)
- z/OS UNIX System Services Messages and Codes
- <http://www.ibm.com/servers/eserver/zseries/zos/le/assist/r9errno2.html>

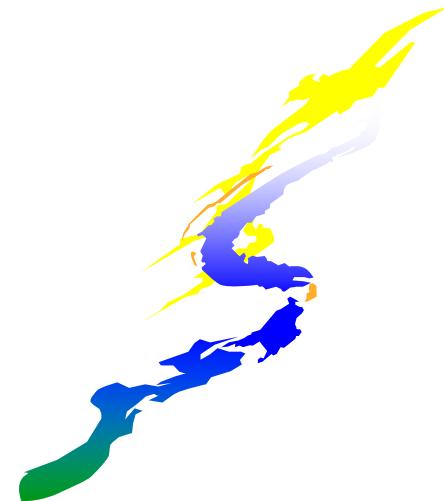

# Sources of Additional Information

- z/OS Language Environment Debugging Guide
- z/OS Language Environment Programming Reference
- z/OS MVS IPCS Commands
- z/OS UNIX System Services Messages and Codes
- Web site
  - <http://www.ibm.com/servers/eserver/zseries/zos/le/>

**WARNING An invalid DSA pointer was found on traceback while processing  
 DSA: 20EE13F0 and CAA: 20EE5A20**

:

# Reconstructing a Vandalized Stack...

## The Clues:

- **CEECAADDSA, “Dummy DSA”** – First Stack Frame on the stack
- **Backchain Pointer** – Location in stack frame that points to previous stack frame, offset X’04’
- **Next Available Byte, “NAB”** – Location in stack frame where next stack frame is to be built, offset X’4C’

## The Tool: IPCS **RUNCHAIN** command

- Processes a chain of control blocks
- Input: Starting address, “link” offset

# Reconstructing a Vandalized Stack...

## Complications

- More substantial damage to the stack can make this task much more difficult
- NAB is only useful for current stack segment
  - Use “LEDATA ‘STACK’” to identify additional stack segments
  - Use RUNCHAIN command on first stack frame in the segment (Starts at offset X’18’ into stack segment)  
OR
  - Increase initial stack segment size with STACK run-time option so that NAB is always in current stack segment

# Interpreting Raw Data

Manually mapping storage is tedious:

20F016B0	00104001	20F01510	20F018D0	A0ED8730	. . . . 0 . . 0 . } . . g .
20F016C0	80072020	A0ED85C0	20EFE048	00000000	. . . . . e { . . \ . . . .
20F016D0	20ED4478	20ED6288	20EFD100	00000000	. . . . . h . . J . . . .
20F016E0	00FD8640	00058A80	000581BC	20ED42E8	.. f . . . . a . . . Y
20F016F0	20ED83C0	20EE5A20	00000004	20F01850	.. c { . . ! . . . . 0 . &
20F01700	20F015B0	20ED3FA8	20F016B0	20EFE048	. 0 . . . . y . 0 . . . \ .

+04 = backchain

+10 = Called routine

+4C = NAB

. . .

There has to be a better way!

# Interpreting Raw Data...

## IPCS CBFORMAT Command

- Formats a control block
- Syntax: CBF(ORMAT) <cbaddr> STR(<cbname>)
  - <cbaddr> can be address or symbol
  - STRUCTURE support provided by various components
    - IPCS Commands, Appendix D for MVS control blocks
    - Language Environment Debugging Guide for LE control blocks
      - CEExxx for AMODE 24/31 (CEECAA, CEECIBH, CEEDSA, CEEEDB, CEEHANC, CEESTKH, etc.)
      - CELxxxx for AMODE 64 (CELCIBH, CELDSA, CELEDB, CELLAA, CELLCA, CELSANC, etc.)
