

# Fit For Purpose

Joe Temple  
IBM

[jliitemp@us.ibm.com](mailto:jliitemp@us.ibm.com)

8/9/2011  
Session 09772

# Key IBM Initiatives

- Smarter Planet
- Smart Computing
- Big Data
- Workload Optimization
- Cloud
- *Fit for Purpose*

## What is F4P?

*Fit for Purpose is a client centric thought process that when applied yields rational platform choices which are in line with the client's requirements and local conditions.*

It is based on the fundamental principles that “one size does not fit all” and that “local factors matter”.

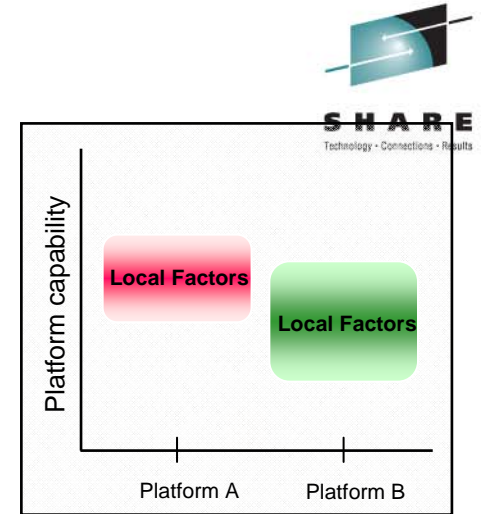

# In a Nutshell 1

A lot to consider

## Local Factors Matter

- Skills
- Technology adoption
- Management
- Volume of servers
- Organizational

## Scale Matters

- Changes people dynamics
- Increases handoffs
- Affects testing, patching, etc

## Workloads Matter

# In a Nutshell 2

Service Level

Throughput

Efficiency

There are operational trade offs

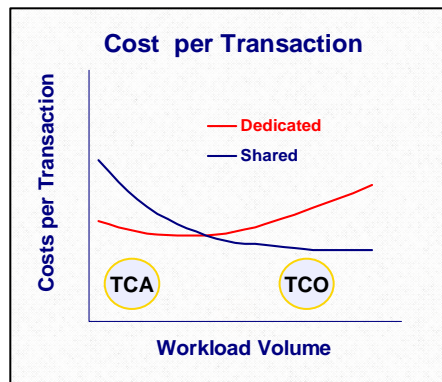

Serial Fitness

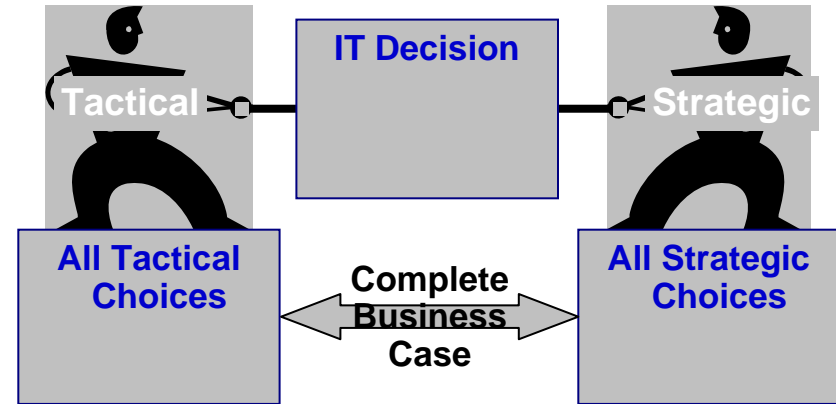

Parallel Fitness

Data Fitness

There are server design trade offs

Beware of the hidden cost of sub optimization  
Chargeback models often distort the selection process

Strategic and tactical balance matters

**SHARE**  
Technology • Connections • Results

# Workload Optimization: F4P is not the same thing

## Workload Optimization – One size does not fit all

### Analytics and High Performance

### Transaction Processing and Database

IBM has used IDC market segments to differentiate workloads

### Web, Collaboration and Infrastructure

### Business Applications

Fit for purpose views the same segments differently  
*An SAP solution will exhibit any or all of these types*

**Mixed Workload – Type 1**

- Scales up
- Updates to shared data and work queues
- Complex virtualization
- Business Intelligence with heavy data sharing

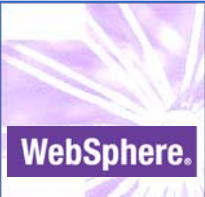

**Parallel Data Structures – Type 3**

- Scales well on clusters
- XML parsing
- Business intelligence with little data sharing
- HPC applications

*Application Function    Data Structure    Usage Pattern    SLA    Integration    Scale*

**Highly Threaded – Type 2**

- Scales well on large SMP
- Web application servers
- Single instance of an ERP system
- Some partitioned databases

**Small Discrete – Type 4**

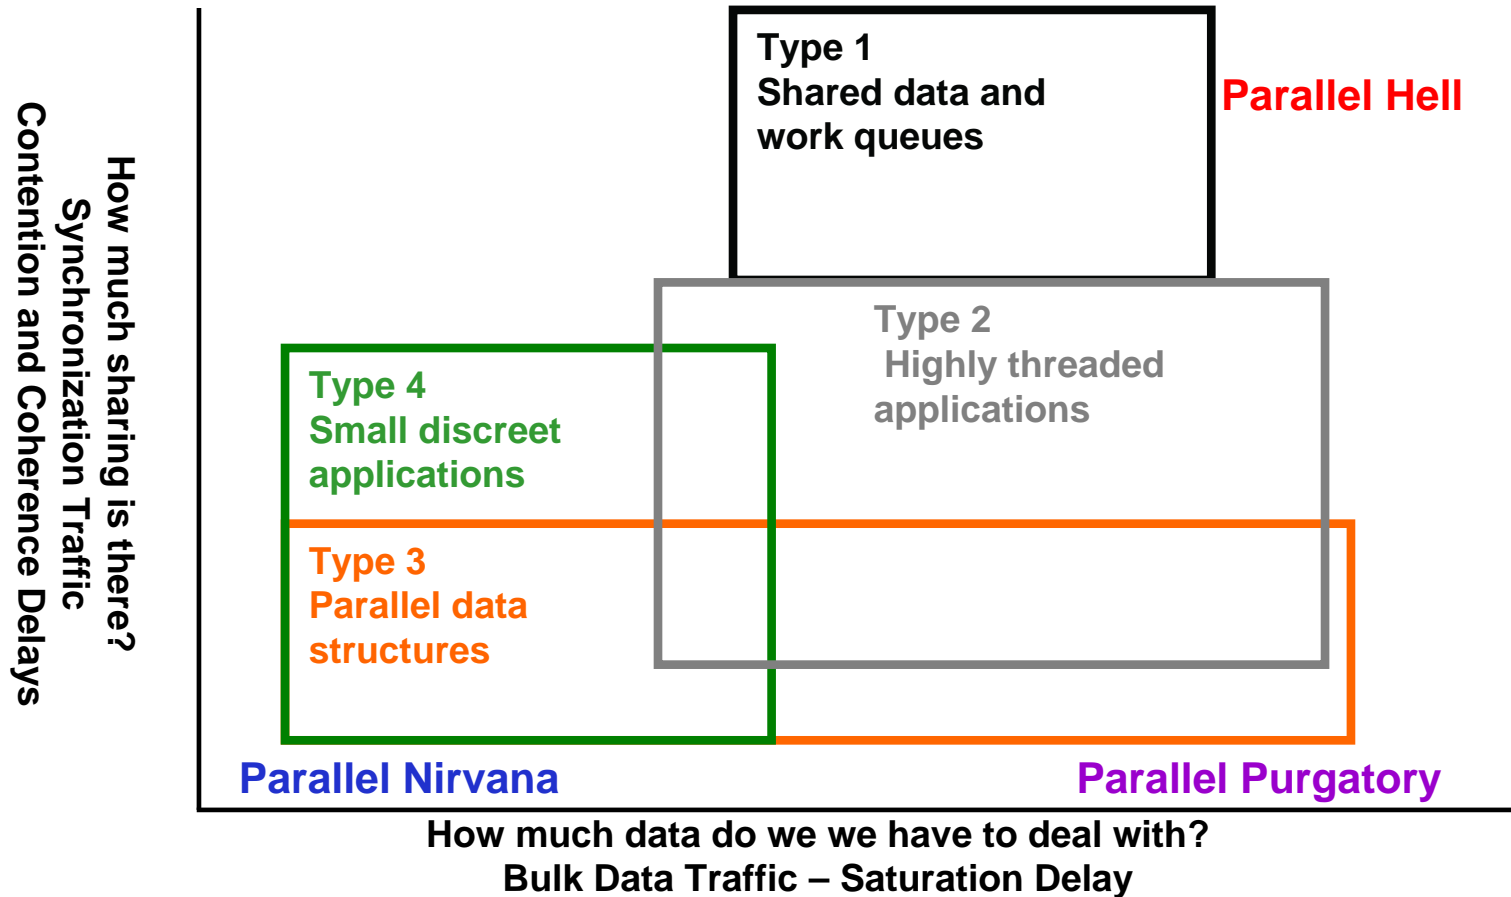

- Limited scaling needs
- HTTP servers
- File and print
- FTP servers
- Small end user apps

Black are design factors

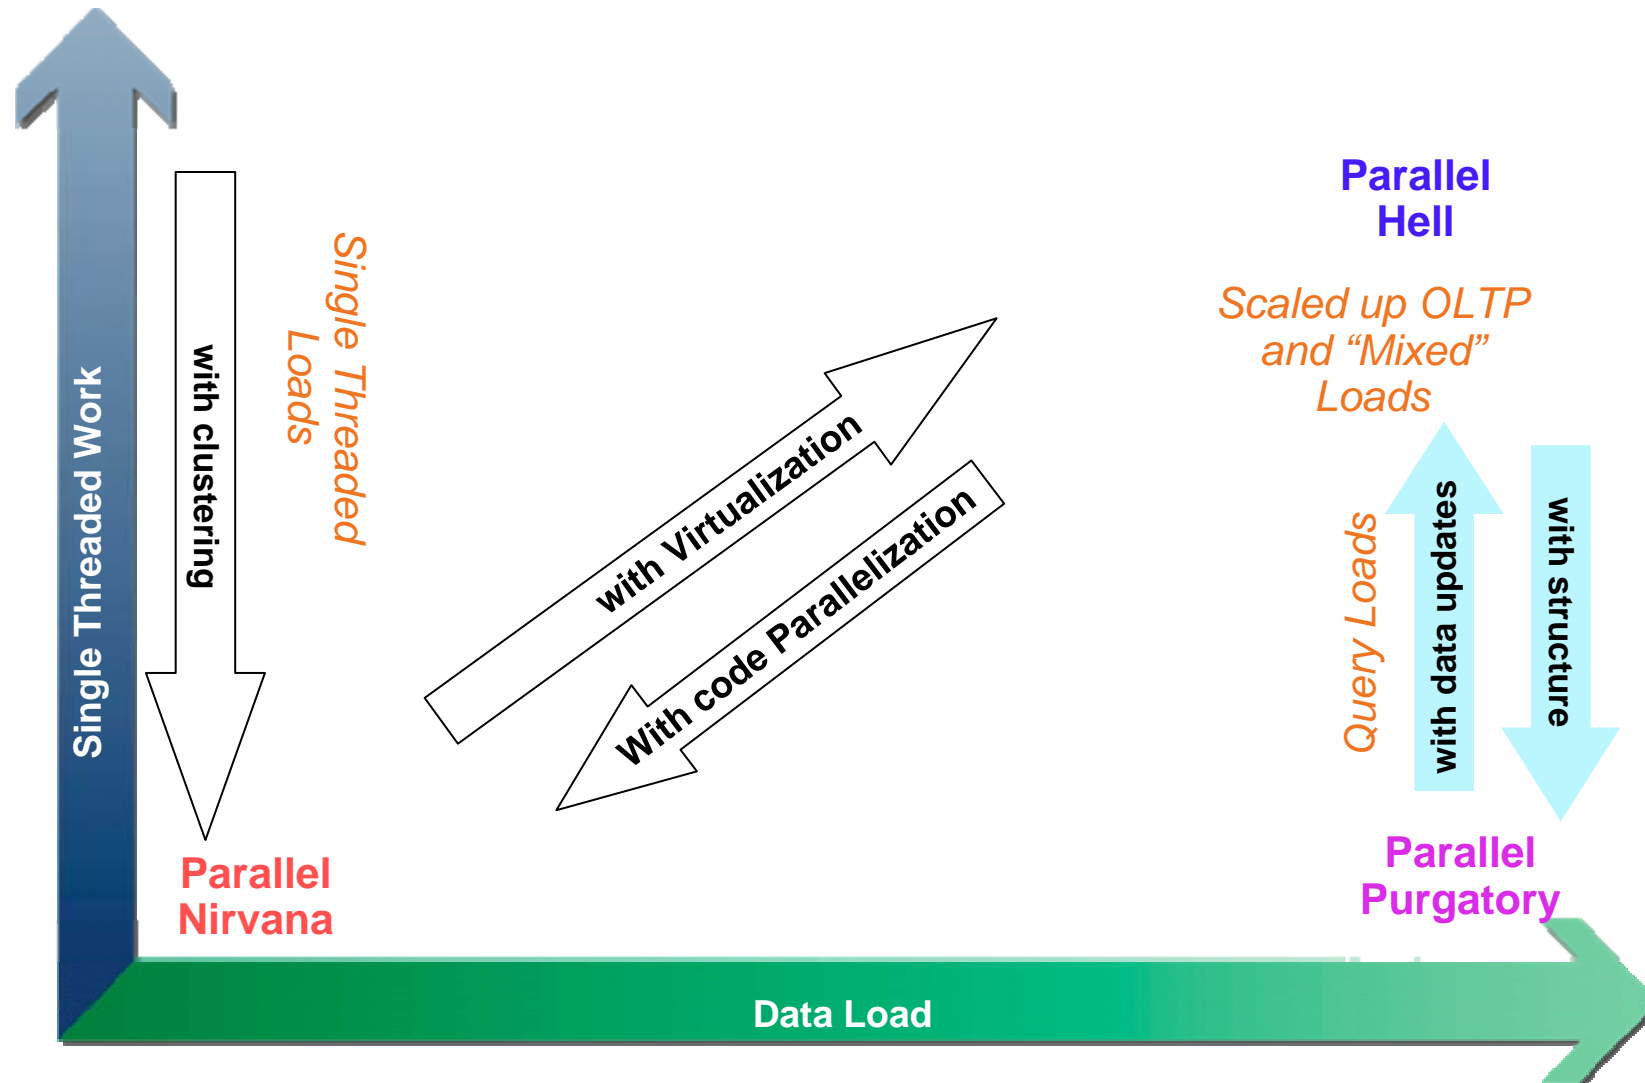

Blue are local factors

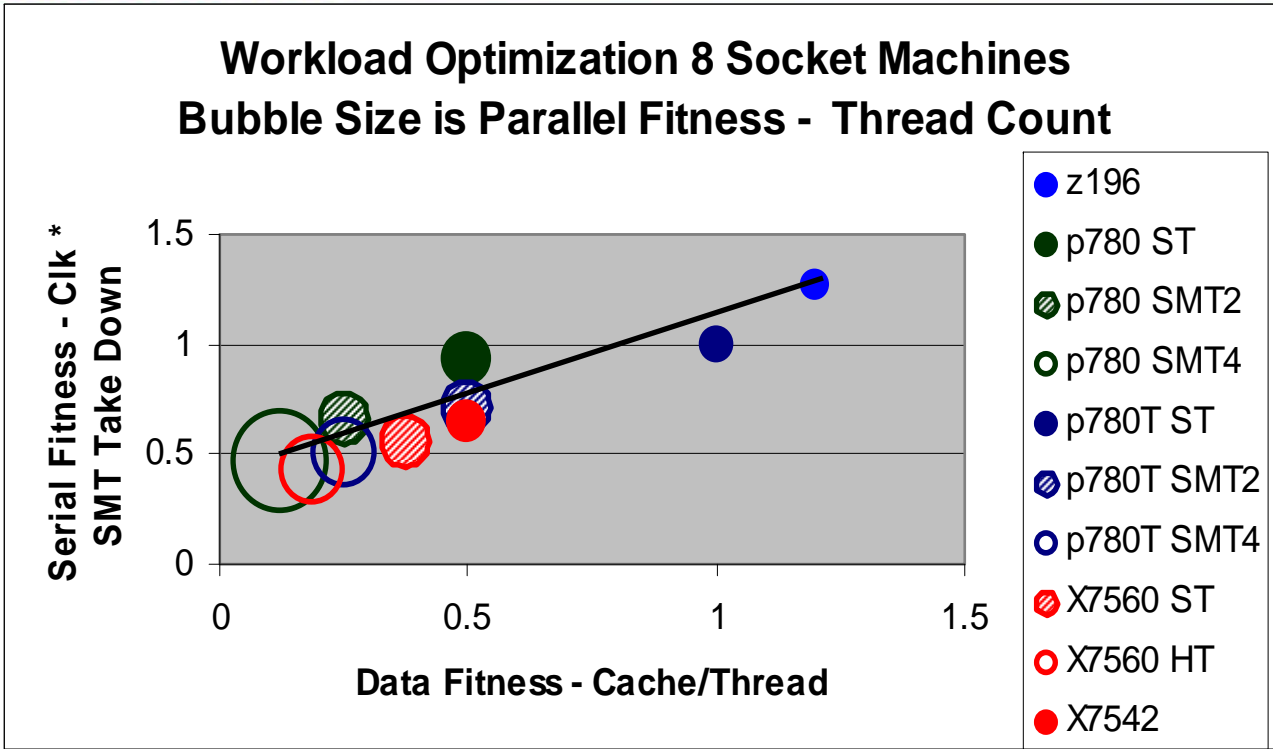

# Workload Types and Pfister's Paradigm

# Pfisters Paradigm: One size does not fit all

You can put any machine on this chart  
All you need to know is:  
Clock Speed  
Top Level Cache Size and Sharing Scope  
Core Count and Thread Count per Core  
Throughput Claim for Multithreaded Cores

The SMT Take down is 1/SMT throughput multiplier. This is an application of “Little’s Law”

The trend line comes out of the page on the lower left.

There is a clear trade off at work here:

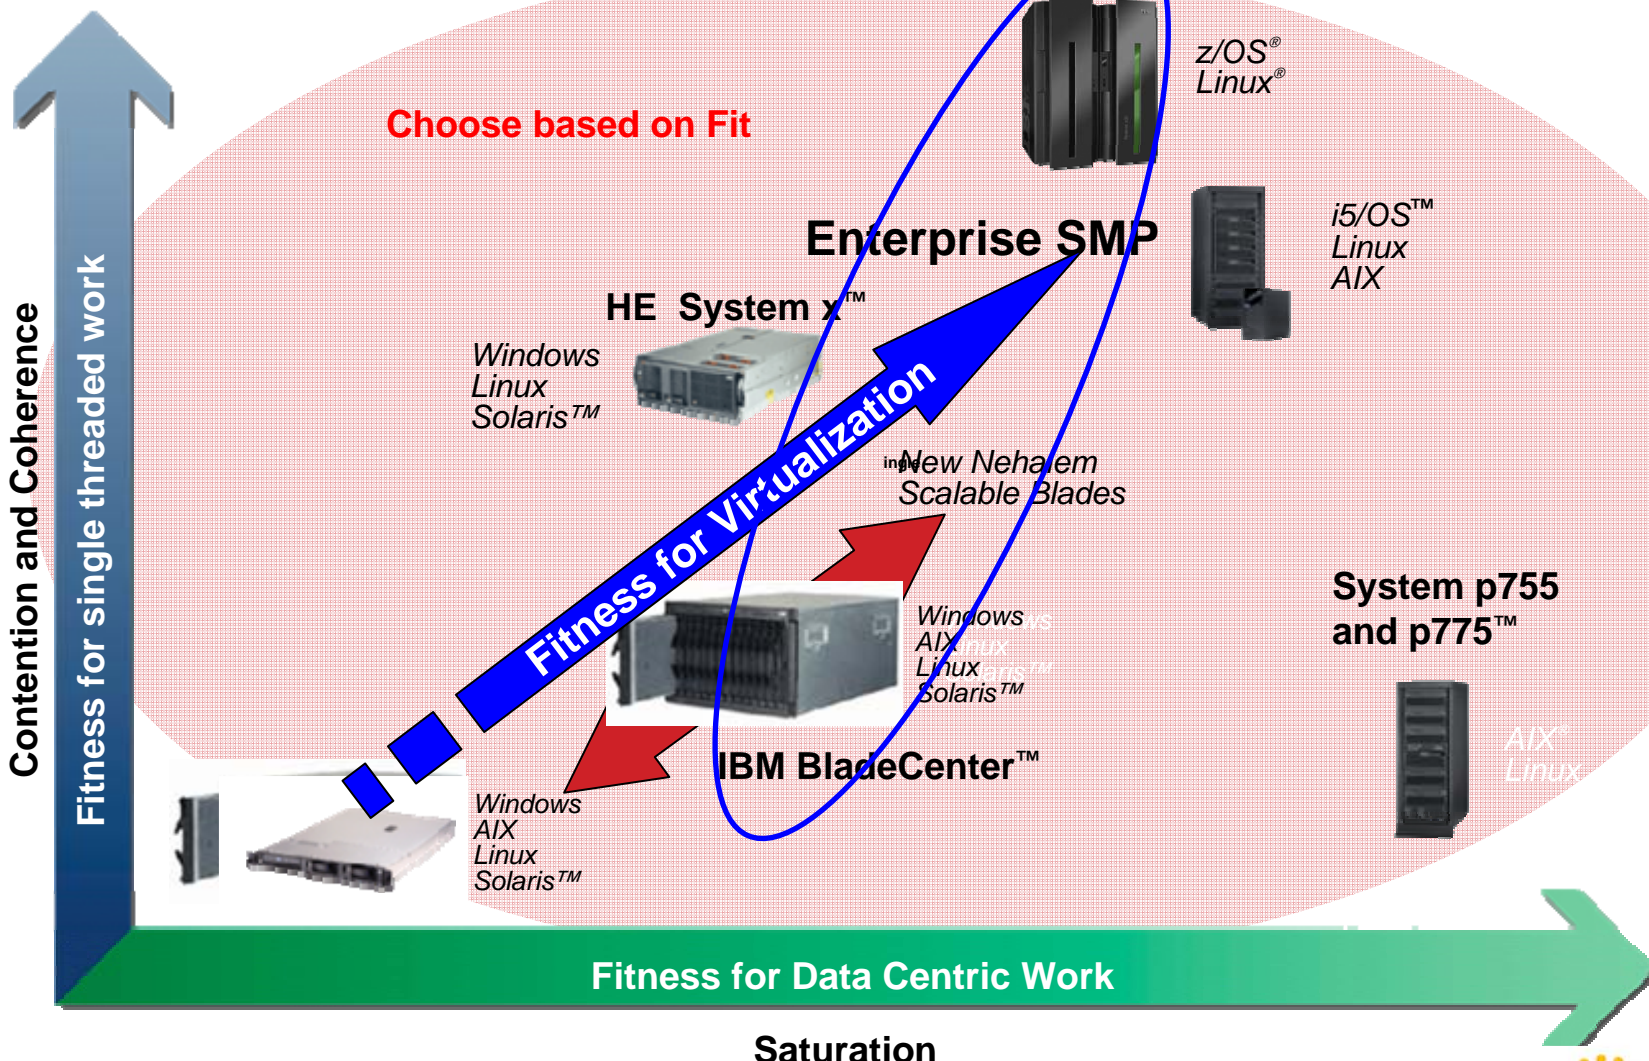

To have more concurrent threads you must give up thread speed and cache/thread

Note: Each brand will define capacity in an advantageous way which is why fundamentals work better than benchmark derived metrics.

# IBM Systems are fit for purpose and cover key legacies

Private Connection

User Network

## Hybrid Computing

### Hybrid APIs available today

#### Open CL Language

– Math accelerator API

#### WebSphere Compute Grid

– JAVA API

#### CoZ Launcher

– Batch to secure shell API

# Cloud is not about deployment model or server type.

- Cloud is simply a layer of software
  - Fills gaps from underlying platform in workload management, provisioning, etc.
  - Provides for self service by clients
  - Provides a chargeback mechanism by which clients rent services
    - IAAS     Infrastructure as a Service
    - SAA     Software as a Service
    - AAAS    Application as a Service
    - DAAS    Data as a Service
    - BPAAS   Business Process as a Service

# Clouds are platforms

- When designing them there are fit for purpose decisions in choosing the underlying infrastructure
- When employing them there are fit for purpose decisions about using them

# Another way to look at the data

This leads to the notion of a “trade off triangle”

**Sign in my office:**

**It's about the Client, stupid**

*Local factors not only matter, they rule the day*

# Server positioning is not enough

- The positioning above is about the application and data design v machine design.
- What about the local factors?
  - Usage Pattern
  - SLA
  - Integration
  - Scale

## The Operational Tradeoff Triangle

The Local Factors are related to this triangle through “Normalized Headroom”

Service Level

Throughput    Efficiency

Service Level

Throughput                      Efficiency

Service Level

Throughput                      Efficiency

Service Level

Efficiency

Throughput

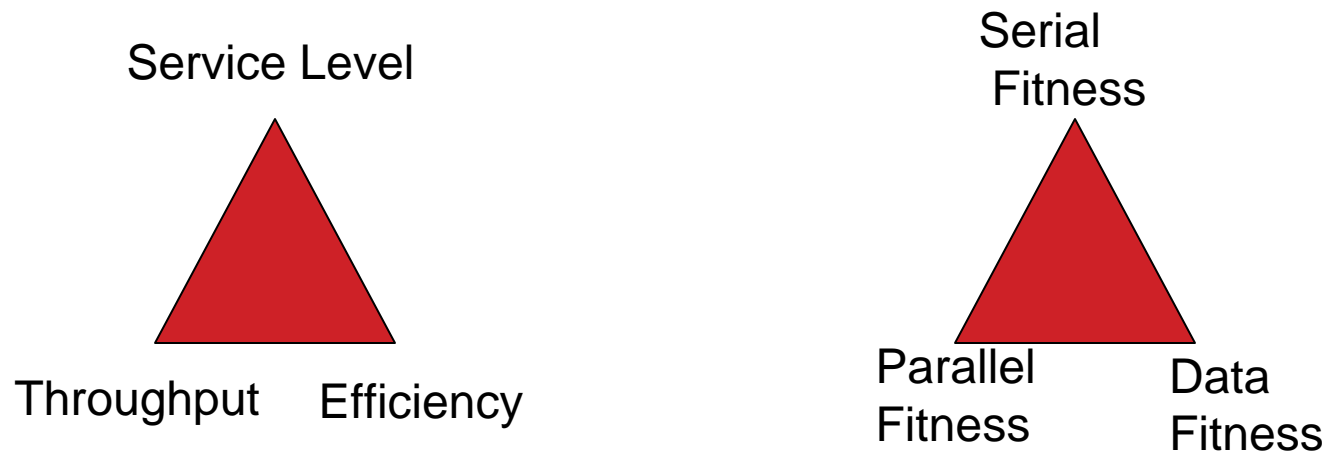

# The Operational Tradeoff

Governed by “Normalized Headroom”

- $HR = (1-u)/u = c^2 N t_0 / t_{\text{wait}}$
- $HR(\text{avg}) = kcN^2$
- $U = 1/(1+HR)$
- $t_{\text{wait}}/t_0 = c^2 N / HR = c^2 N u (1-u)$
- $t_{\text{wait}} = (t_0)(c^2 N)(u/(1-u))$   
= (capacity)(variability)(utilization)  
M/G/1 system

## So how do we relate the two triangles?

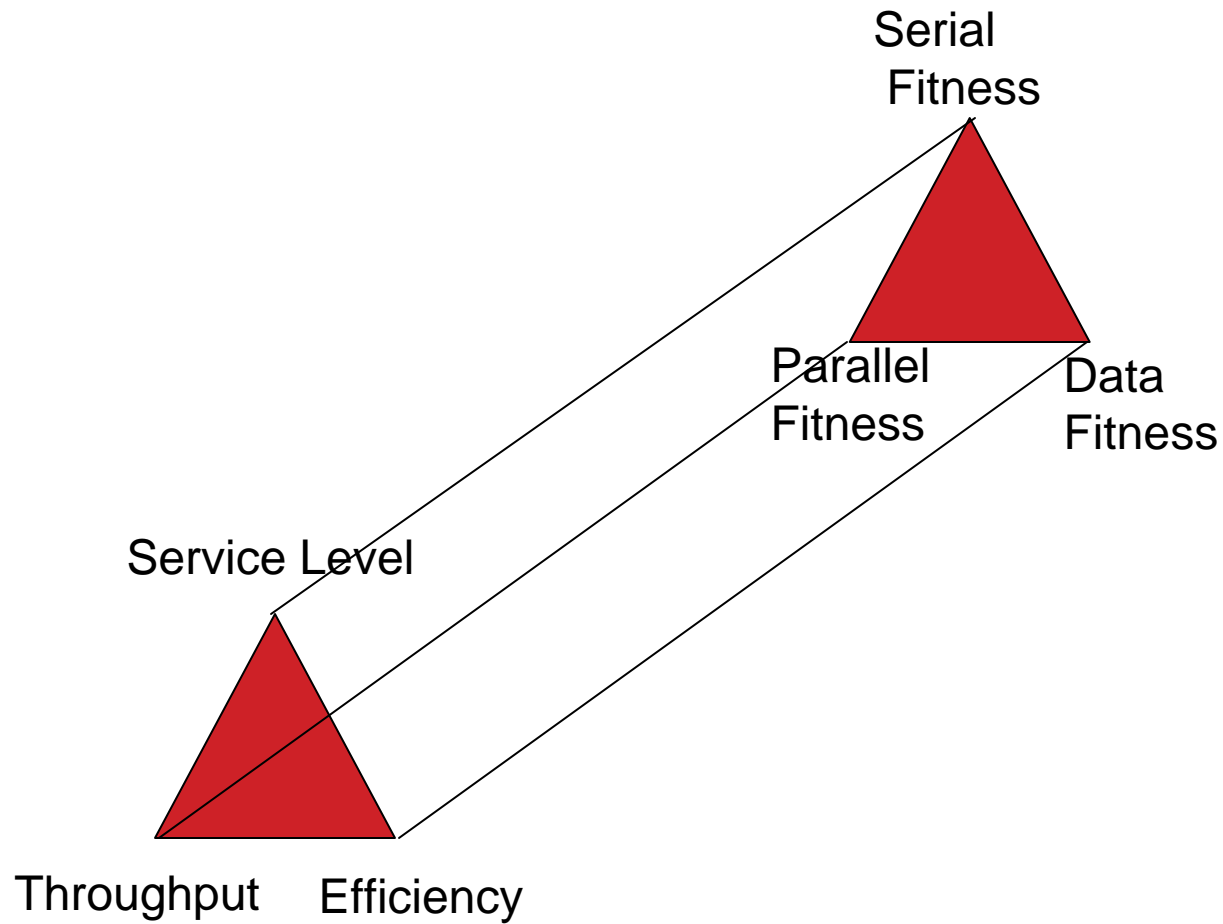

Parallel Fitness primarily drives throughput , but can drive Service Level (Wait Time)

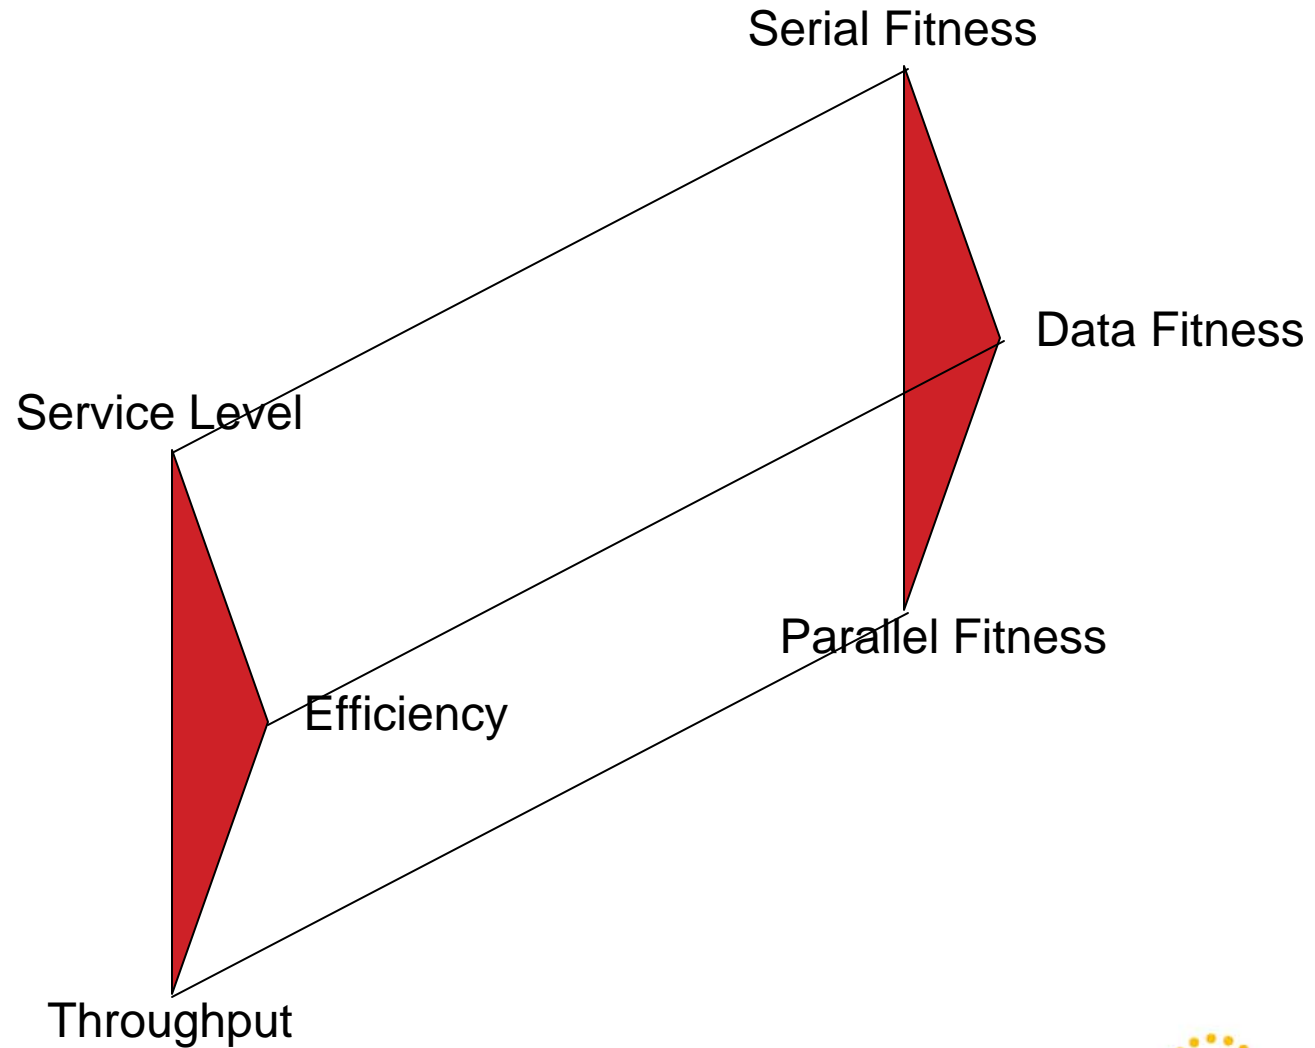

Serial Fitness primarily drives Service Level (Service Time) but will also drive throughput

Data Fitness primarily drives Efficiency by forestalling saturation, but can drive Service Level by maintaining low service time at higher loads.

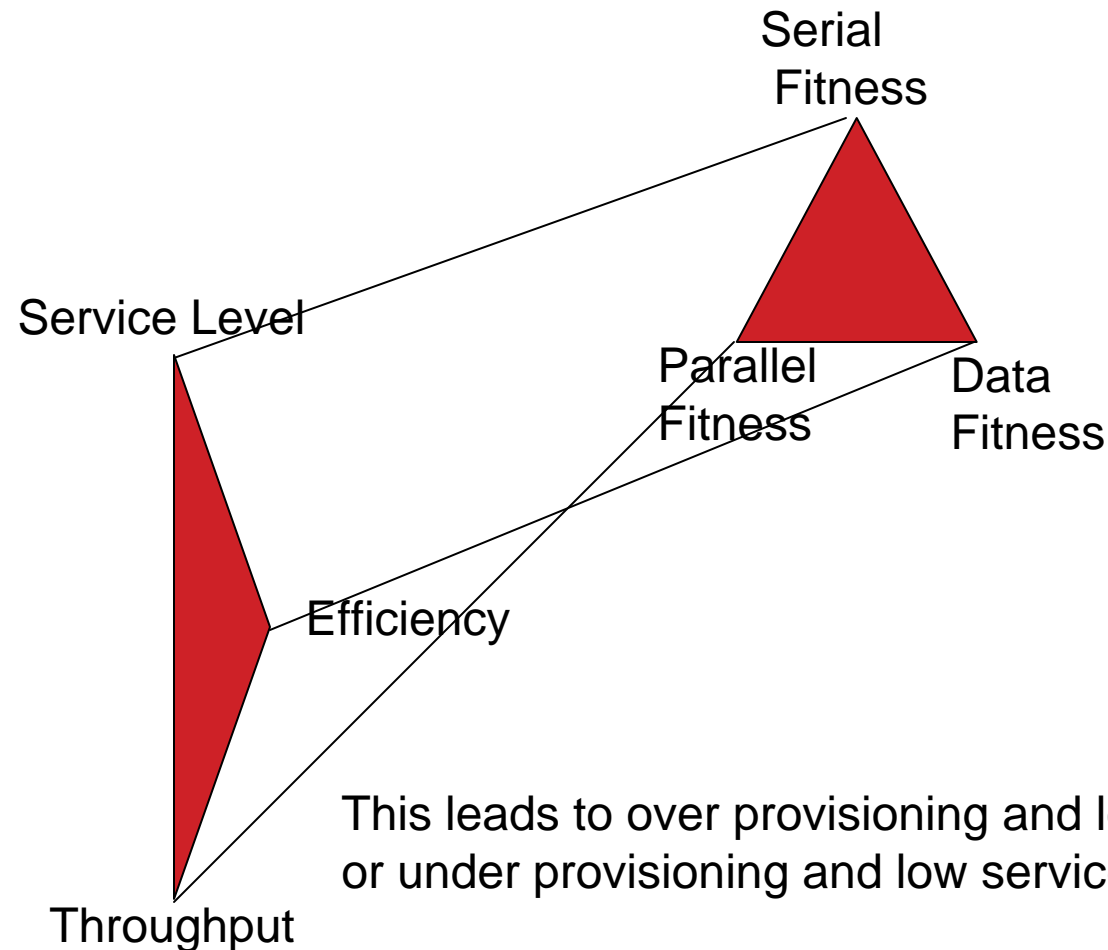

So there is a primary corner to corner relationship

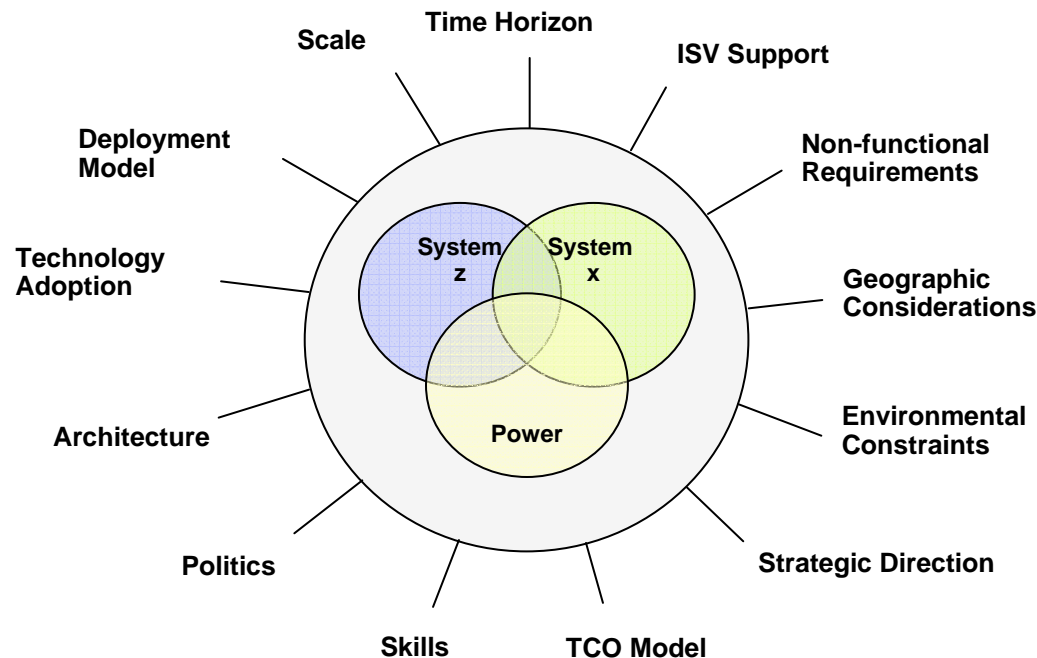

## The local factors distort the Client's Tradeoff

Sometimes the local factors are at odds with the design.

## And that is just the workload optimization story

Client support is delivered through F4P Discussions, Briefings, Workshop Offerings, and ongoing System Architect support.

Always check to see if an SA is engaged or can be engaged for this work

# Workload is usually just one row of the F4P workshop output

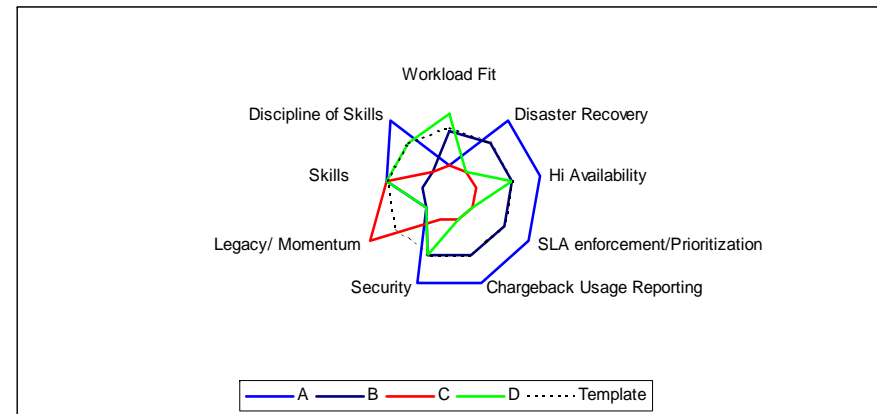

## Weighted Scores

Weight		A	B	C	D
3	<b>Workload</b>	6	9	3	6
1	Disaster Recovery	3	2	1	1
2	Hi Availability	4	4	2	4
1	SLA enforcement/Prioritization	3	2	1	1
1	Chargeback Usage Reporting	3	2	1	1
2	Security	6	4	2	4
1	Legacy/ Momentum	1	1	3	1
3	Skills	9	3	9	6
1	Discipline of Skills	3	1	1	2

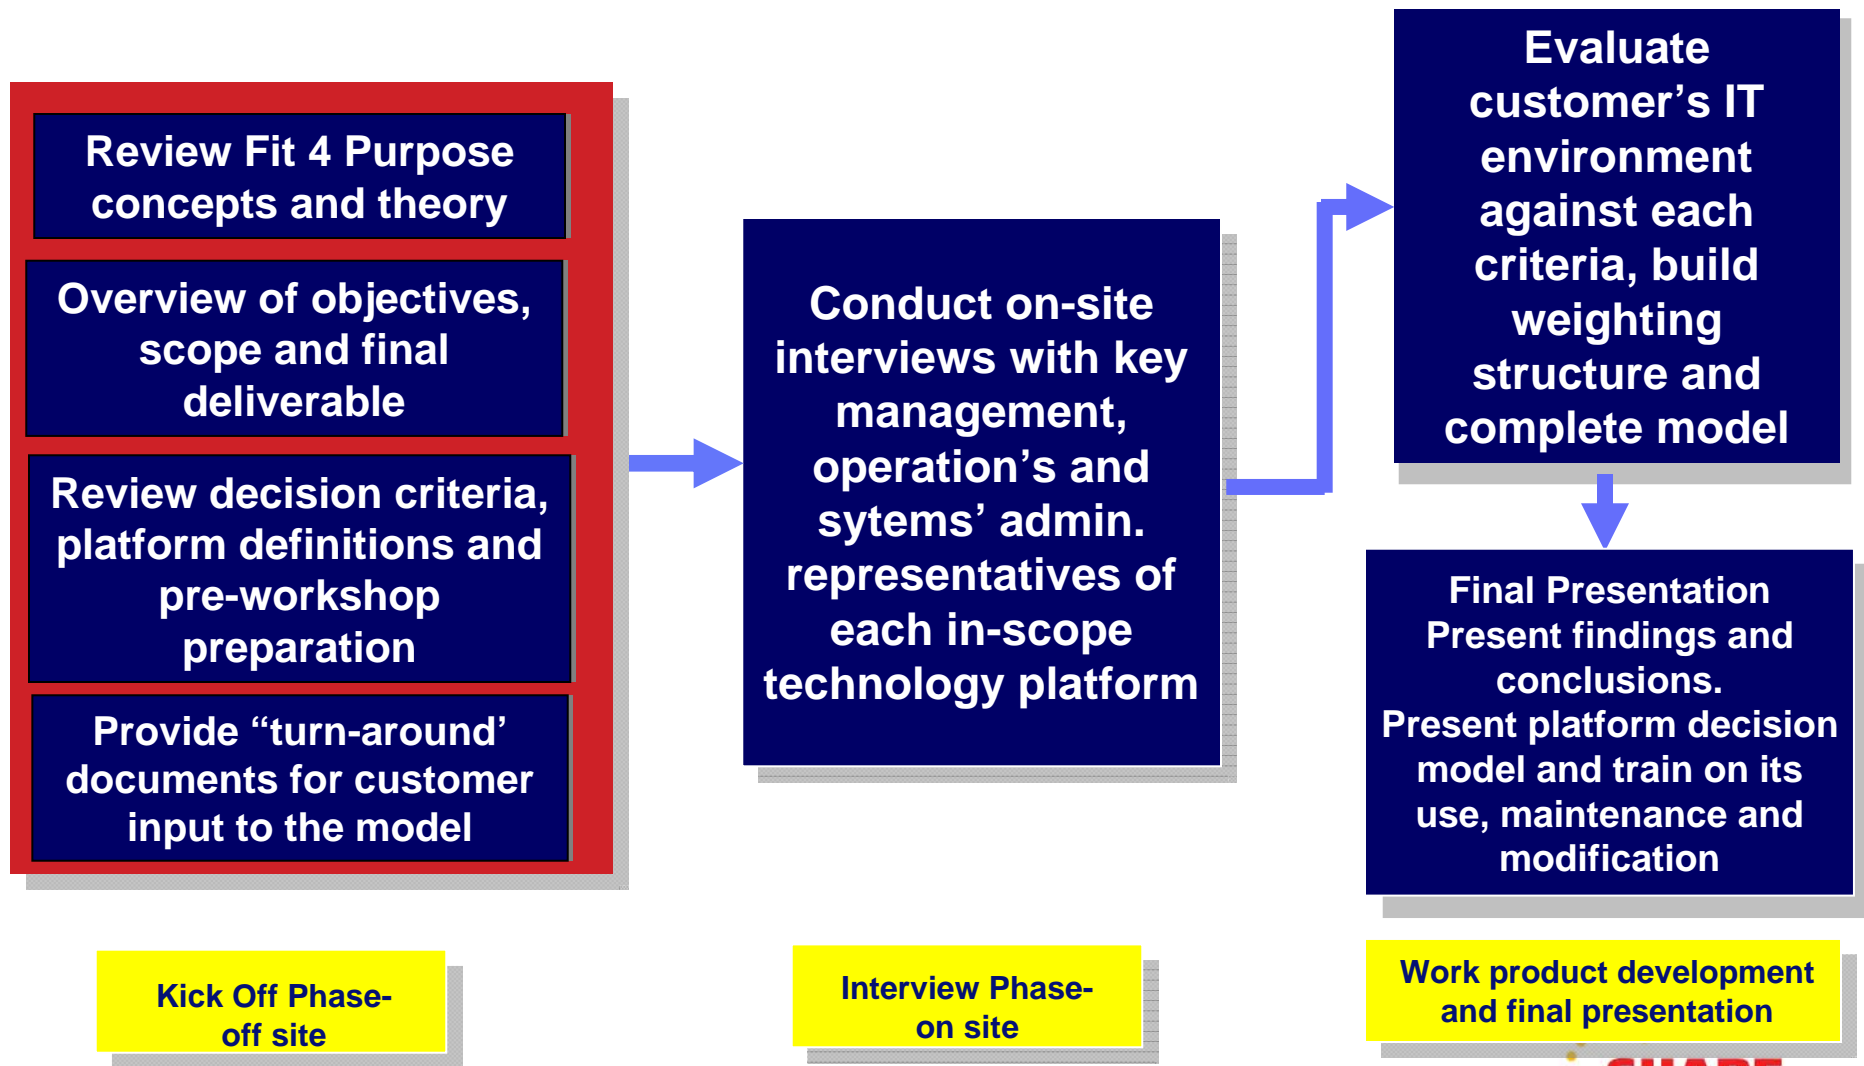

# Which can yield value/requirement matching input and “foil” for TCO analysis

A provides best total value  
 B has best value match  
 C is most inline with local strategy

## Lab Services Fit for Purpose workshop work flow

# The lab services model: More comprehensive, precise and broader scope

**Key**

	Customer data entry
	Customizable
	Calculated cells; Avoid changing
	Calculated cells; Avoid changing
	Calculated cells; Avoid changing

**REMEMBER TO USE A NEW COPY OF THE MATRIX FOR EACH ANALYSIS SAVING A COPY AS DOCUMENTATION.**  
**REMEMBER TO INPUT ANY "APPLICATIONS" SPECIFIC WEIGHTINGS ON TAB 3.**

## Lessons Learned

- The scope & impact will be strategic in nature.
- Relationships are key and everyone has to “behave”
  - Failed workshops have usually been caused by excessive product advocacy
- Customers like what they are seeing and are telling us they are working to determine how they will incorporate it into their own decision making process going forward.
- F4P proved to be a significant competitive advantage.
- For clients seeking answer to the question, “where do we run this application?”
  - Fit for Purpose is framework to help you decide.
  - An in depth dialog with the customer – pros and cons, tradeoffs, etc.
    - *Not a sales call... consultative*
    - *Identify value differentiators and weightings*
    - *Ongoing reuse of “local factors” climbs a learning curve*
- Indeed one size does not fit all; we have both mainframes and “Watson” for good reasons.

## Key Challenges

- Being Client Centric in a brand dominated environment
  - Requires a strong minded client first approach
  - Avoid advocacy: F4P is more about “listening” than “telling”
    - There is a fine line between articulating value and platform advocacy
    - The client defines the line by the questions asked and assertions made
- Avoiding our own brand centric biases
  - We all come with baggage
  - Many things that “everybody knows” are not true
    - Most of what you know about relative capacity falls into this
  - Avoid accepting the common wisdom about “the once and future platform”
  - Need to avoid gaming the system unintentionally
  - Can’t tolerate those who game the system intentionally
  - AHP method can help
    - Pairwise comparison of requirements and platforms
    - Can’t see overall picture until the end
    - Hard to apply spin until done.

# Questions

## Some “Light Reading” on the Topic

- “Server Platform Selection and Positioning”, Lebsack, Dixon CMG Conference Proceedings, December, 2009..
- Dr. Gregory Pfister , In Search of Clusters, the ongoing battle in lowly parallel computing, Second Edition, Prentice Hall, 1998
- Roger Rogers and Joe Temple, “Relative Capacity and Fit for Purpose Platform Selection”, CMG Journal of Computer Management, no 123, March 2009
- Dr. Neil Gunther: Guerilla Capacity Planning
- Rick Lebsack and Joe Temple “Fit for Purpose Platform Selection, a Workload View” on IBM Techdocs and pending CMG Journal
- See Joe Temple for drafts: “The Operational Trade off Triangle”, “The Server Design Trade off Triangle” and “Using Normalized Head Room for Infrastructure Analysis and Design”
