

Overview of CA's New Linux on System z Management Offerings and z/VM Products Update

March 13, 2012 - SHARE Session 10336

Brian Jagos & Summer Spaulding
CA Technologies

Abstract

In this session, we will review the CA Linux on System z management suite that was announced in August 2011 and will show how these products can be used in conjunction with CA's existing VM solutions to provide holistic monitoring, management, and troubleshooting of your Linux on System z and z/VM environments. We will also cover recent enhancements to the CA VM product suite and will share CA's roadmap for longer-term features and enhancements.

Agenda

- Review of CA offerings for Linux on System z Management
- Practical Example using zVPS Performance Suite, UPSTREAM for Linux on System z, and CA VM:Manager
- CA z/VM Product Suite Update and Roadmap
- Questions

Changing the way the mainframe is managed forever!

1. THE MARKET

Mainframe Platform Drivers

- Business Growth
- Hardware Evolution
- Mainframe Virtues

2. THE CHALLENGES

Control Costs

- Do More...
- "...with less"
- "...with nothing"

Sustain Critical Skills

- Build next generation team dynamically
- On ramp for next gen is long and complex

Increase Agility

- Provision services faster
- Multiplatform data center
- Solve critical issues

4. THE PROGRAMS

Promises Made

Maximize Value

1

Simplify Management

2

Practical Innovation

3

Promises Kept

Customer Engagement
Technology Exploitation

Mainframe Software Mgmt
Mainframe Stack

Integration, Productivity,
and Insight

3. THE STRATEGY

Maximize
Value

Simplify
Management

Practical
Innovation

Best in Class Quality, Support, and
Customer Experience

CA Solutions for Linux on System z strategy

Secure

Agile

Optimized

- Simplify the management and security of Linux on System z with a comprehensive and integrated management suite
- Make Linux on System z a cost-effective choice for customers
- Agility delivered - allow clients to quickly deliver capacity on demand with Linux on System z

CA Solutions for Linux on System z

overview

- **Product enhancements and strategic partnerships will help you reduce costs, improve performance and more efficiently manage Linux on System z**
 - ***Current releases of CA VM:Manager Suite for Linux on System z** provide various feature enhancements including support for managing tapes for Linux on System z, and others that help customers install, deploy, and service their CA z/VM products more effectively and quickly*
 - ***Velocity Software zVPS Performance Suite** complements CA solutions with real-time access to detail data from z/VM and Linux on System z platforms for optimized performance, capacity planning and cost chargeback*
 - ***INNOVATION Data Processing UPSTREAM for Linux on System z and UPSTREAM for z/OS UNIX** extend CA data protection capabilities with file level backup for Linux on System z and z/OS UNIX files*
 - ***CA Mainframe Connector for Linux on System z** allows CA z/OS-based automation products to receive event information from Linux on System z environments*
- **Combined, these solutions will help remove barriers and reduce time, cost and risk of consolidating workloads to Linux on System z**

Velocity zVPS™ Performance Suite

optimize z/VM and Linux on System performance

**Best in class
performance management
for Linux on System z**

Combine
multi-platform system
management expertise
from **CA Technologies**

...with the performance
measurement expertise
from **Velocity Software**

Performance Analysis

- Provides real-time metrics on all facets of performance for all servers including z/VM, Linux on System z and distributed servers
- Enables immediate analysis of real-time problems

Operational Alerting

- Optimize operations to meet our SLA's.
- Immediately detect and report performance and capacity issues.

Capacity Planning

- Prevent costly hardware upgrades and data center outages.
- Project capacity requirements of future workloads with comprehensive trend data.

Chargeback and Accounting

- Transition IT from a cost center to a profit center.
- Chargeback Linux on System z resource usage to applicable business or agency with detailed and accurate usage data.

Velocity Software zVPS™ Performance Management Suite

The Differentiators

— *Comprehensive Data Collection*

- z/VM Subsystems (processor, storage, I/O, paging)
- z/VM Guest resources
- Linux on System z – disk, storage, processor
- Networked servers (Linux, Unix, Windows)
- Linux applications

— *High data Capture Rate*

- Critical for accurate analysis, reporting, and accounting

— *Uses existing Linux on System z SNMPD process for data capture*

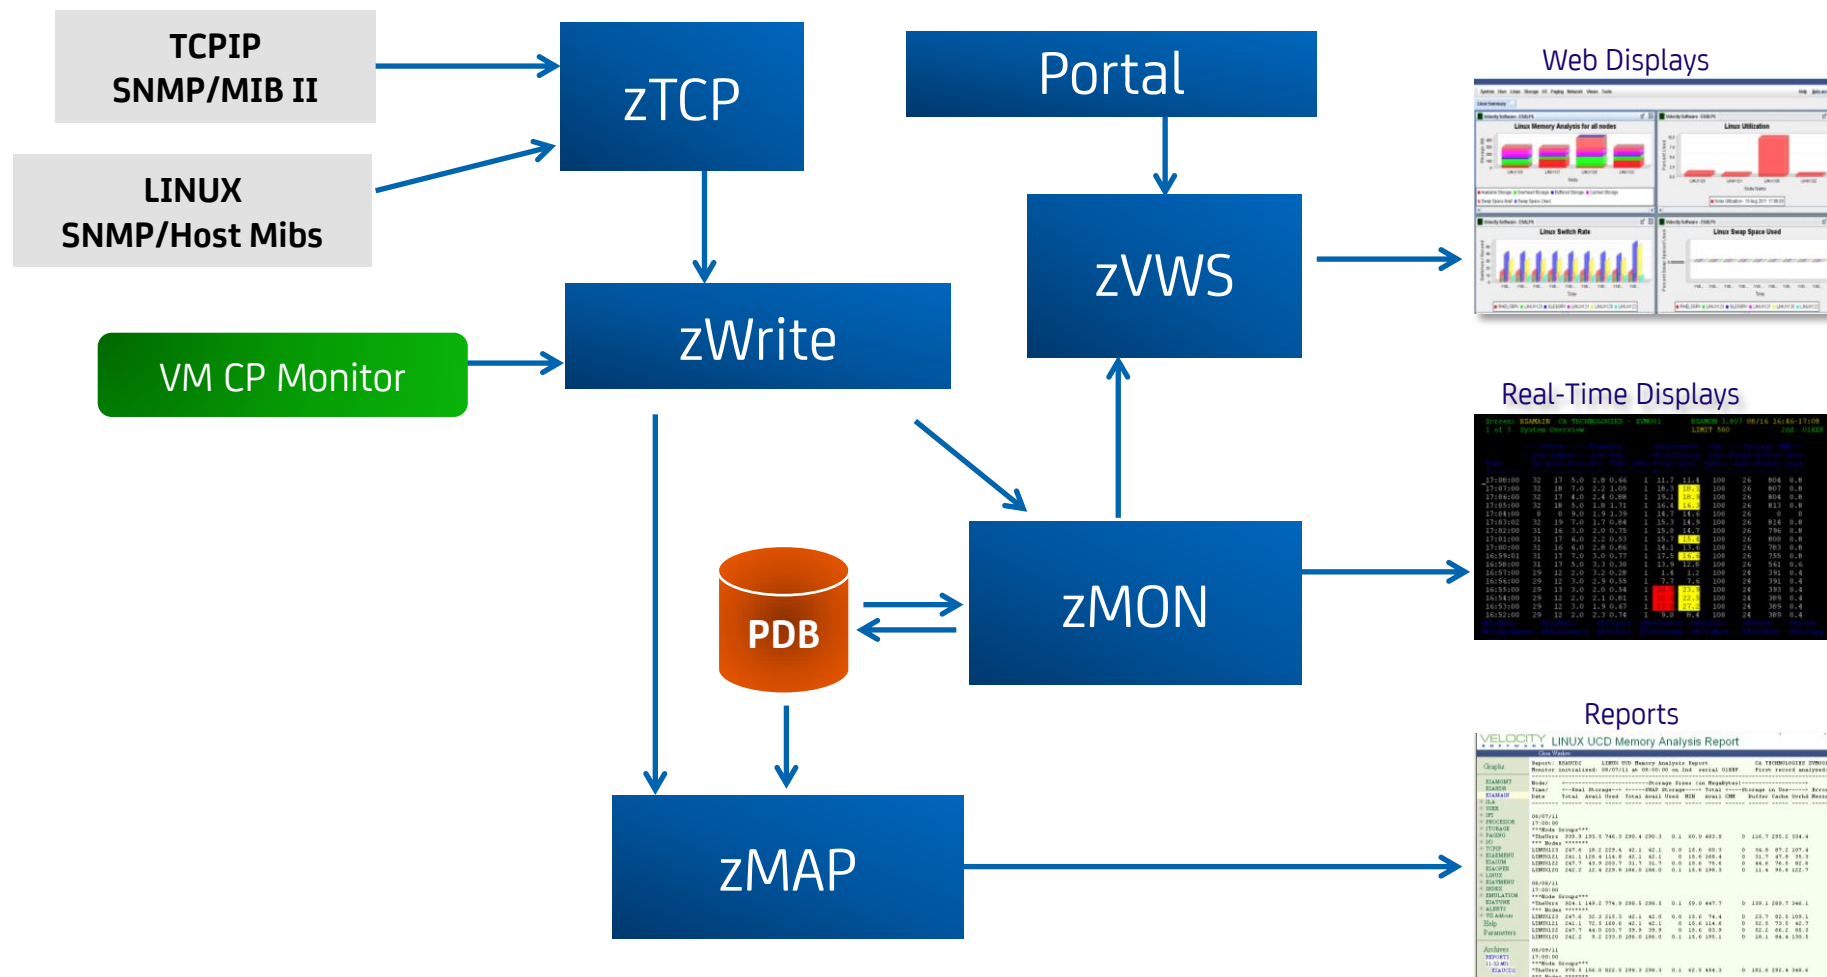

- Eliminates overhead and maintenance of new performance agent

Velocity zVPS™ Performance Suite

solution components

zMON™	Real-time graphical display of up-to-the-minute performance information
zMAP™	Historical performance reporting provides in-depth post-analysis and capacity planning
zTCP™	Network performance monitor for distributed servers, Linux networks and z/VM
zPRO™ Portal	Web-based interface for z/VM and Linux on System z performance management. Also provides zVPS™ product administration
zWRITE™	Data collection facility that reduces monitor data without losing information relevant to proper performance analysis
zVWS™	High-speed web server for optimum z/VM performance and reduced CPU overhead

zVPS Performance Suite architecture

UPSTREAM for Linux on System z

best-in-class data protection

- **Fast, scalable** and highly **reliable** backup and recovery for Linux on System z
- **Only** solution that will **backup up to z/OS**
 - Leverage existing z/OS skills and infrastructure for operational efficiency
 - Rely on proven z/OS disaster recovery strengths

Business
Continuity

Peace of
Mind

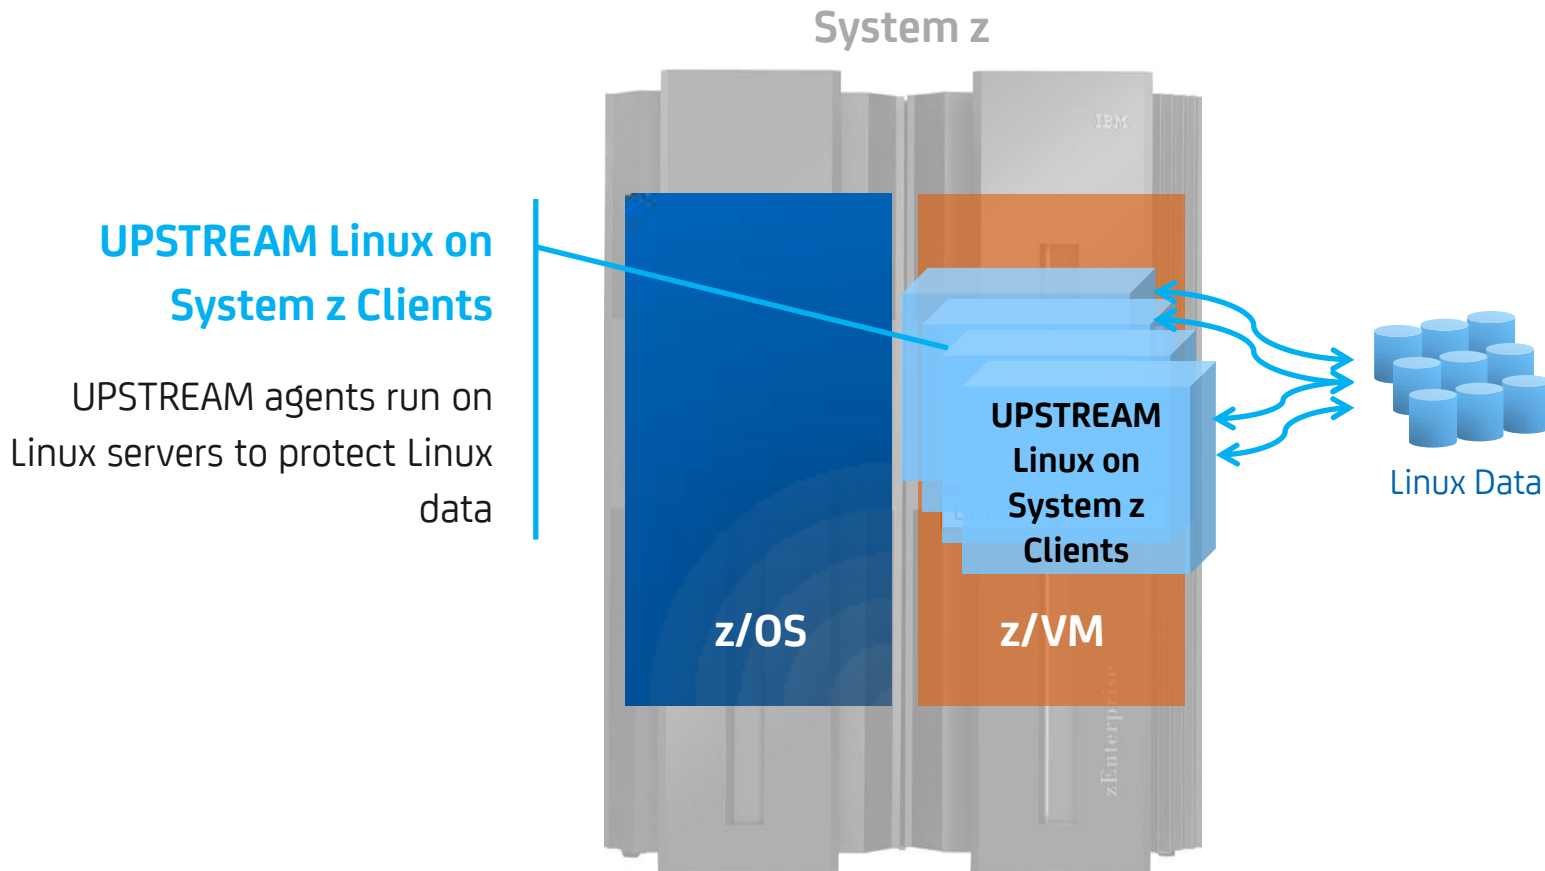

comprehensive backup and recovery for Linux on System z

UPSTREAM for Linux on System z

- Provides continuous business operation for Linux on System z applications
- Extends your investments in existing mainframe resources: CPU, tapes, virtual tape, tape drives, staff
- Protects software investment by utilizing existing z/OS management software
- Extends mainframe security and automated operations to Linux on System z data protection
- Provides backup and recovery for very large amounts of data without negatively impacting corporate network performance
- File level backups directly to z/OS mainframe tape or DASD

UPSTREAM for Linux on System z architecture

UPSTREAM for Linux on System z architecture

UPSTREAM z/OS Storage Server

UPSTREAM is only data protection solution that provides backup to z/OS storage server

Enabling backup to z/OS tape or disk

For increased reliability and compliance

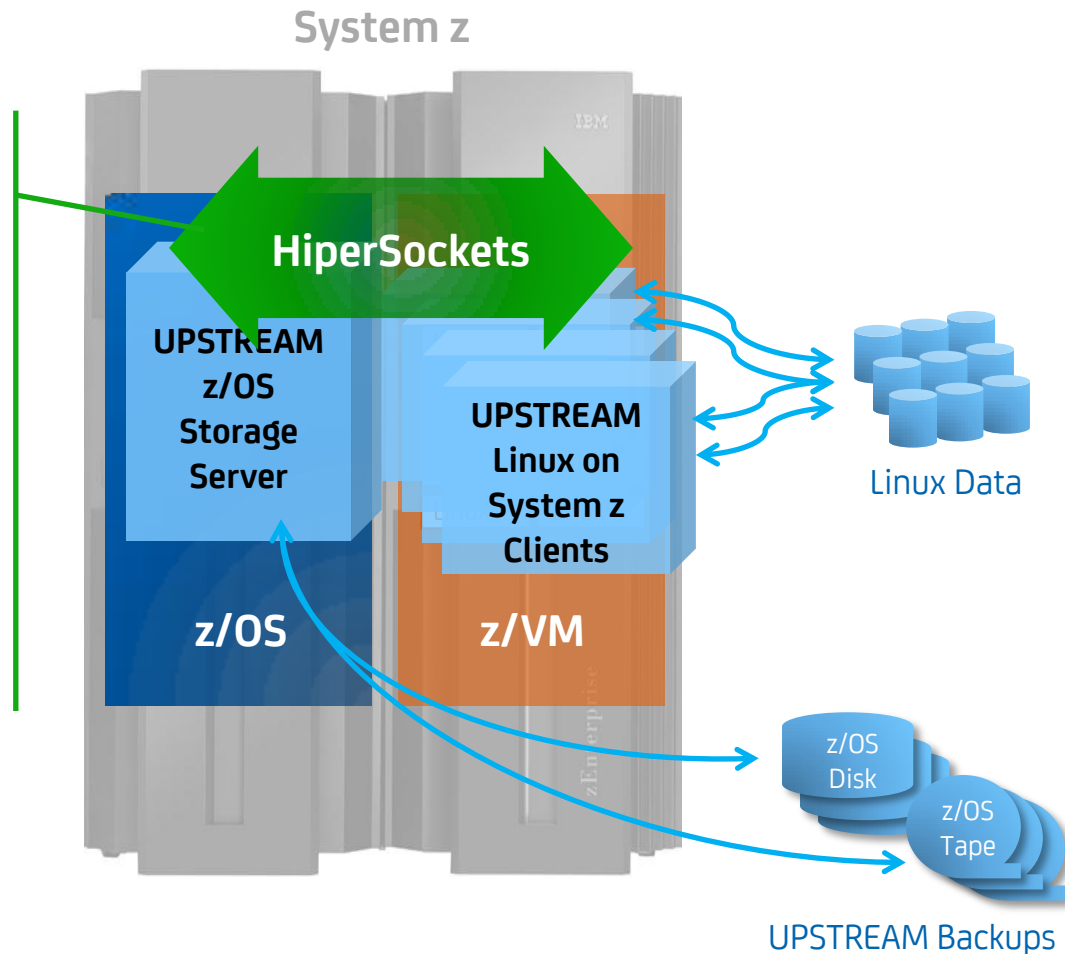

UPSTREAM for Linux on System z

innovative high performance data protection

UPSTREAM exploits HiperSocket Technology

Takes backup and recovery
off corporate network

Protect very large amounts
of data without negatively
impacting corporate
communications or customer
access

UPSTREAM for z/OS UNIX

storage backup for z/OS UNIX System Services (USS)

- Enables centralized storage management of hybrid mainframe environments
- Provides ad hoc and automated, unattended backup/restore, file transfer and storage management operations
- Further leverage strengths of z/OS Unix to manage Web serving, WebSphere, Lotus Domino

Complementary
storage backup
solution that is
sold separately

UPSTREAM
for
z/OS UNIX

File level backup and recovery for
ZFS/HFS files under
Unix System Services for z/OS

CA Mainframe Connector for Linux on System z

Cross-platform automation and integrated message handling for Linux on System z

- Connector for Linux on System z connects CA SOLVE:Operations Automation with z/VM systems and their z/Linux guests via IP Connections
 - Linux on System z and z/VM unsolicited event traffic is normalized and merged with z/OS console messages in CA SOLVE:Operations Automation
 - Linux on System z and z/VM command-and-response functions are available and behave like a specialized z/OS system command
- Available with CA SOLVE:Operations® Automation R11.9 – NO CHARGE!
- **Planned availability with CA OPS/MVS® Event Management and Automation release targeted for mid-2012**

CA Mainframe Connector for Linux on System z

Practical Example

Web DB process fails on LINUX123 after overnight MYSQL upgrade and resolution is to back out upgrade

— ***UPSTREAM[®] for Linux on Z is used for server back ups***

- Full Weekly; daily incremental backups
- MYSQL DB backup script (PREPROCESS) defined in UPSTREAM Backup policies for Preprocessing
 - **mysqldump –uroot –plinux123 winestore –x > /DBbackup/winestore_backup.sql**
- Restore performed from local server dump file – retain one copy on server
- MYSQLD startup script modified to generate message to operator on successful start

Practical Example

Scenario – Monitoring and Automation

— *VM:Operator*

- HOLDMSG table used for zVPS Alerts
- SENDMAIL exec triggered by VPSE PRER custom alert
- SECUSER Windows for each Linux on System z server

— *zVPSTM Performance Suite*

- Customized alerts implemented via zMON MONALERT file
- ZALERT service machine running to process zMON alerts
- *zVPSTM MONALERT file includes alert for process monitoring
(**snmpd.conf proc statement**)*

```
# rocommunity: a SNMPv1/SNMPv2c read-only access community name
# arguments: community [default|hostname|network/bits] [oid]
```

```
rocommunity velocity
```

```
#####
```

```
# SECTION: Monitor Various Aspects of the Running Host
```

```
#
```

```
# The following check up on various aspects of a host.
```

```
# proc: Check for processes that should be running.
```

```
# proc NAME [MAX=0] [MIN=0]
```

```
#
```

```
# NAME: the name of the process to check for. It must match
# exactly (ie, http will not find httpd processes).
```

```
# MAX: the maximum number allowed to be running. Defaults to 0.
```

```
# MIN: the minimum number to be running. Defaults to 0.
```

```
#
```

```
# The results are reported in the prTable section of the UCD-SNMP-MIB tree
```

```
# Special Case: When the min and max numbers are both 0, it assumes
```

```
# you want a max of infinity and a min of 1.
```

```
proc snmpd 0 1
proc usdaemon 0 1
proc uscmd1 0 1
proc mysqld 0 1
proc vsftpd 0 1
```

SNMPD Configuration: MYSQLD is defined on server as a monitored process

```
# disk: Check for disk space usage of a partition.
```

```
# The agent can check the amount of available disk space, and make
# sure it is above a set limit.
```

```
#
```

```
# disk PATH [MIN=100000]
```

```
#
```

```
# PATH: mount path to the disk in question.
```

```
# MIN: Disks with space below this value will have the Mib's errorFlag set.
```

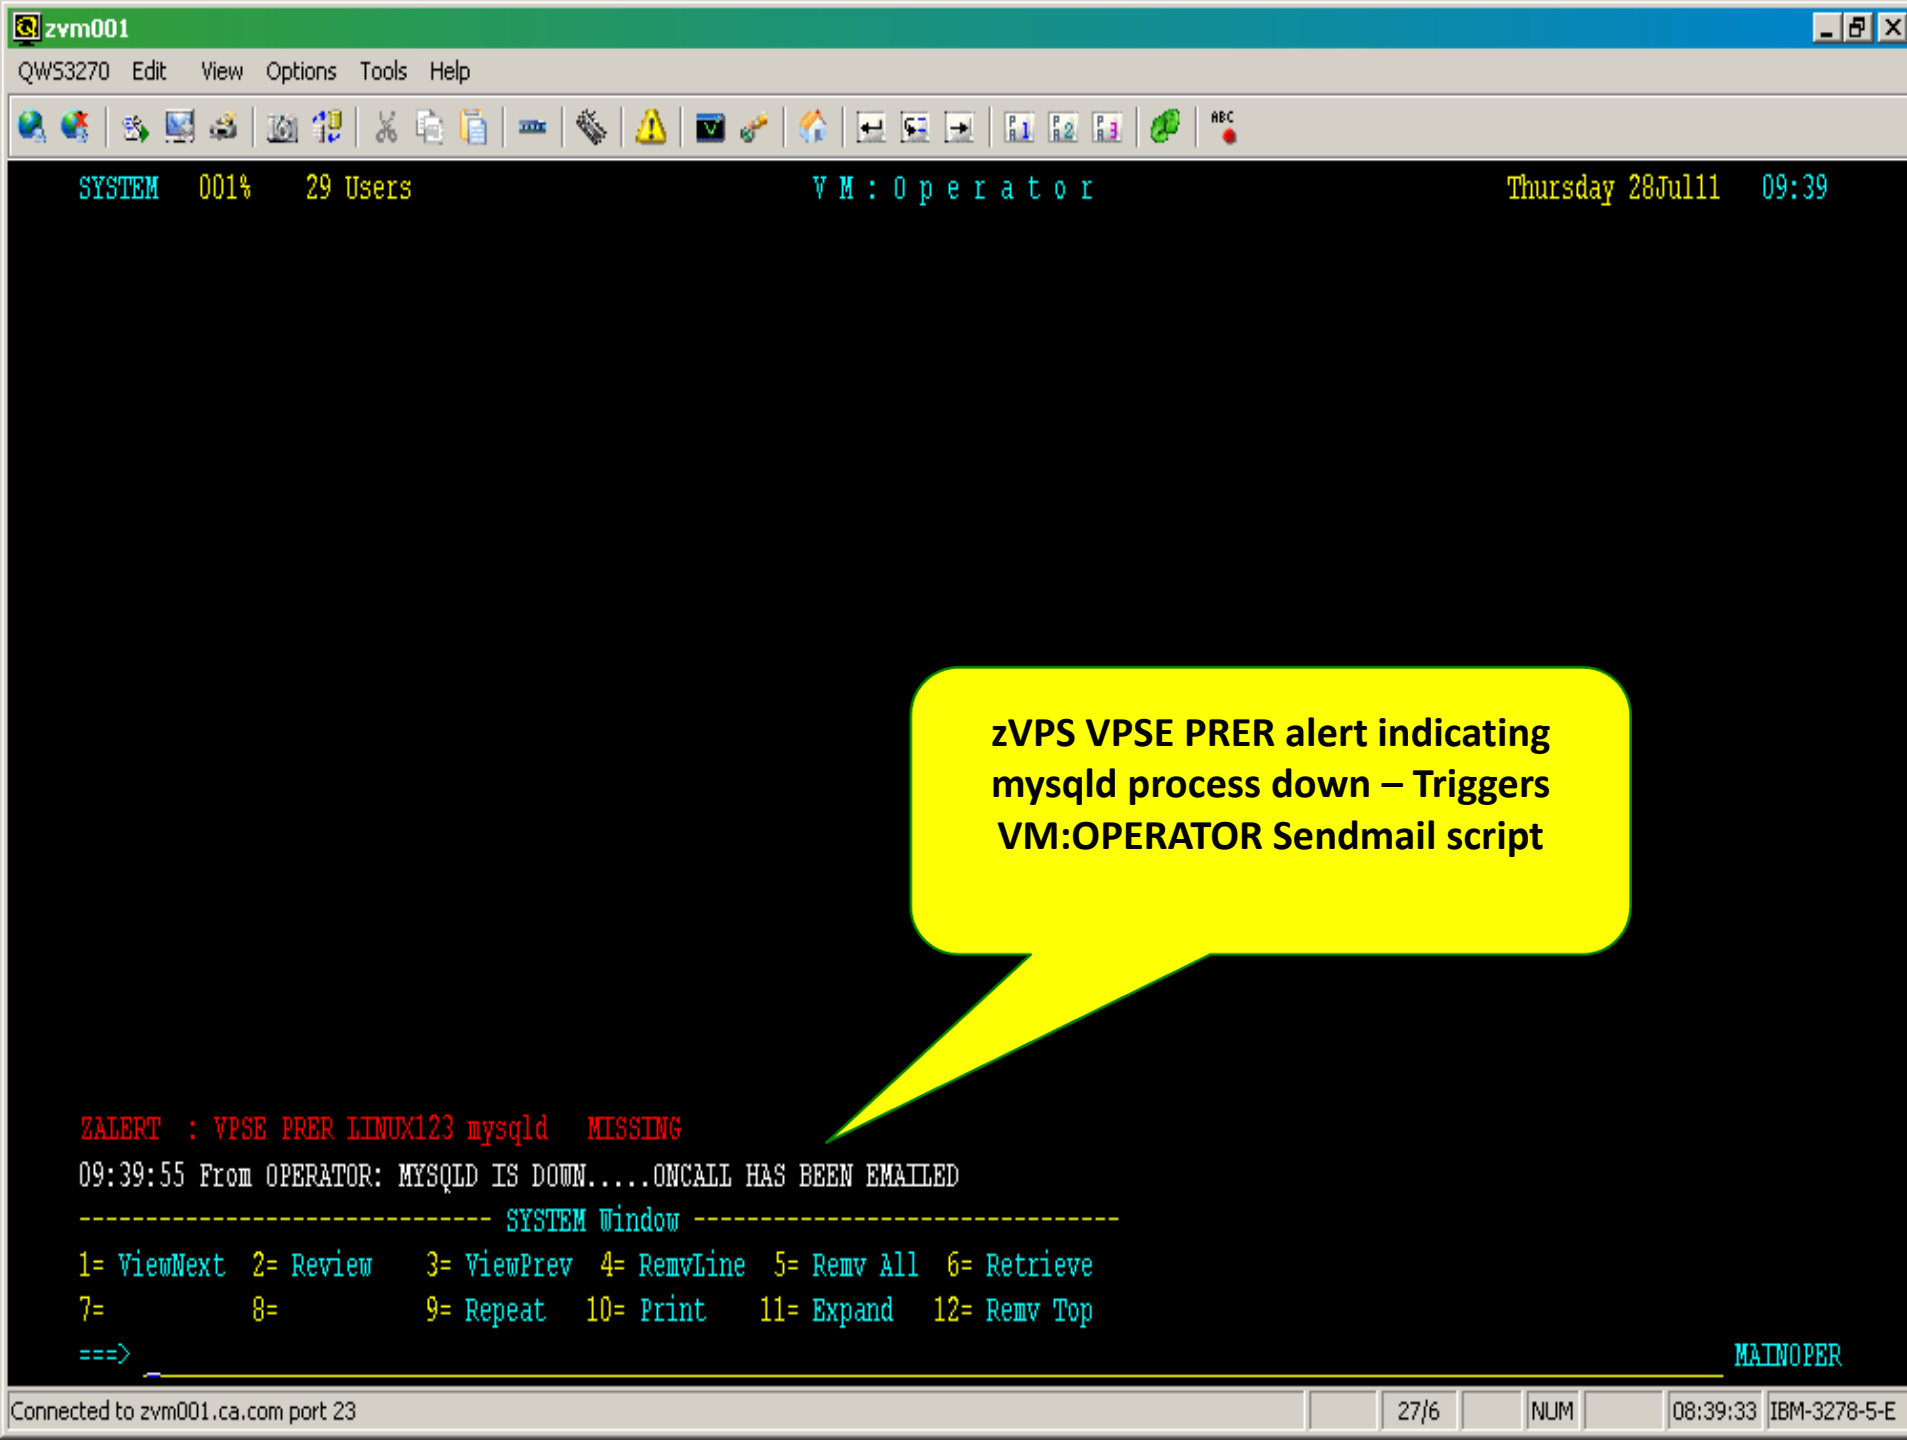

```

Tape Management

CA VM:Tape™
CA Dynam/T for z/VM

CA z/VM solutions and Mainframe 2.0

reduce complexity – speed implementation

standardize on IBM VMSES/E to install and service all CA z/VM products

- industry standard procedures reduce “experience pool” requirements
- consistent look and feel enables products to be managed without a significant skills investment
- common procedures for all products reduce complexity, speed implementation

CA Mainframe VM Product Manager

- install and maintain products in single library, deploy wherever needed
- automatic provisioning of servers with CA VM:Secure or CA VM:Director

infrastructure enhancements

common code infrastructure improvements:

- **additional products ported to exploit CA VM Common Nucleus collection of services and routines**
- **single z/VM object directory reader program called by all products requiring directory look-up services**

using common code across products enables CA Technologies to deliver new features, enhancements, and problem solutions more quickly and efficiently

CA VM:Tape Linux on System z Interface features

- Exploit VM:Tape functionality in Linux applications
- Mount tape from Linux on System z
- Hardware support via IBM Linux kernel driver
- TCP/IP used for Linux to VM:Tape communication
- Shipped in standard RPM package
- Centralized tape management on Linux guest that does not expose sensitive interfaces (such as VMCP) to regular users
- Regular (non root) users are able to mount tapes
- After successful mount there are corresponding devices in /dev owned by the user who issued the mount
- Provides authorization handling for both mounted and saved tapes

Additional CA VM:Tape enhancements

CA VM:Tape

MOUNT command enhancement

- Use new user exit USREXIT9 to retrieve information about tape drive
- Enables operators to make decisions about automation and action routines

MOUNT and CANCEL message enhancements

- Real device address added to messages 0014I, 0051T, 0100I to enhance their use for automation purposes

VMTAPE QUERY enhancements

- QUERY VOLUME command displays additional information about tapes
- Display information about deleted tapes and tapes not in TMC if maintained in IBM or STK robotic tape subsystem

QUERY command authorization change

- OPERATOR authorization no longer required for QUERY, QUERY TAPES, and QUERY REQUESTS
- Users can obtain information about pending MOUNT and ALLOCATION requests

additional CA VM:Manager Suite enhancements

CA VM:Account

- Toleration support for CPU type codes
- Cost table support for switch class devices

CA VM:Archiver

- SYSID resolution
- Additional linemode command
- Additional parameters passed to VMAEXIT1

CA VM:Backup

- Option EDRSUP default set to ON
- CA VM:Backup HiDRO Feature encryption support

CA VM:Schedule

- Passphrase and DMSPASS/DMSPWCHK support enables z/VM logon password phrases of up to 200 characters

CA Explore Performance Management for z/VM

- Data collection via IBM standard monitor records

CA VM:Account

CA VM:Archiver

CA VM:Backup

CA VM:Schedule

CA Explore Performance Management for z/VM

SSI Support

CA VM:Secure Release 2.9 and 3.0 enhancements

VMCIPHER and file encrypting logic and configuration of RC2 encryption removed

- ability to use obsolete encryption algorithms is removed
- promotes use of stronger encryption algorithms to improve security for sensitive data
- capability to encrypt data using DES, Triple DES, and AES is retained

VLAN rules support

- support added for controlling access to Guest LANs and virtual switches
- access requests made explicitly by issuing the COUPLE command or implicitly by defining a value for the LAN operand on a NICDEF CP Directory statement
- COUPLE rule definition replaces GRANT operand on a SET VSWITCH or SET LAN command
- For a VLAN-aware virtual switch, set of VLAN ID values may be defined to restrict access to specified IEEE VLANs
- COUPLE RULE option grants PROMISCUOUS mode access for special purpose network debugging programs

CA VM:Secure Release 2.9 and 3.0 enhancements

New Commands –

The following commands are new and support managing the directory in an SSI environment.

– SUBCONFIG

- Use the SUBCONFIG command from an IDENTITY user to bring up a screen presenting the names of all SUBCONFIG entries, which are part of the user virtual machine definition. Users can modify their SUBCONFIG entries from this screen.

– CHGENTRY

- Use the CHGENTRY command to convert a USER directory entry into an IDENTITY entry or an IDENTITY entry into a USER entry.

– CMD

- Use the CMD command to route another command to an Agent product server in a Single System Image environment. The routed command will execute on the specified Agent server.

– TAKEOVER

- The TAKEOVER command converts one of the Agent product servers into a Master product server.

CA VM:Secure Release 2.9 and 3.0 enhancements

New Configuration Record

The following PRODUCT CONFIG record is new and supports CA VM:Secure in an SSI environment.

– SSINODE

- Use the SSINODE record to identify the names of members of a Single System Image complex, and to specify that the Object Directory is to be compiled in an SSI-Ready format.

New Utility

The SSIENAB EXEC is a new utility that converts all BUILD statements in the source directory from BUILD ON * to BUILD ON “membername”. This utility is used when converting from a NON-SSI environment to a SSI environment.

CA VM:Secure Release 2.9 and 3.0 enhancements

Changes to Existing Features

- The ADDENTRY command syntax has been changed to support the addition of a SUBCONFIG into the directory.
- The QUERY command has been updated to add an SSI parameter

CA VM:Director 3.0 enhancements

New Commands

The following commands are new and support managing the directory in an SSI environment.

– SUBCONFIG

- Use the SUBCONFIG command from an IDENTITY user to bring up a screen presenting the names of all SUBCONFIG entries, which are part of the user virtual machine definition. Users can modify their SUBCONFIG entries from this screen.

– CHGENTRY

- Use the CHGENTRY command to convert a USER directory entry into an IDENTITY entry or an IDENTITY entry into a USER entry.

– CMD

- Use the CMD command to route another command to an Agent product server in a Single System Image environment. The routed command will execute on the specified Agent server.

– TAKEOVER

- The TAKEOVER command converts one of the Agent product servers into a Master product server.

CA VM:Director 3.0 enhancements

New Configuration Record

The following PRODUCT CONFIG record is new and supports CA VM:Secure in an SSI environment.

– SSINODE

- Use the SSINODE record to identify the names of members of a Single System Image complex, and to specify that the Object Directory is to be compiled in an SSI-Ready format.

New Utility

The SSIENAB EXEC is a new utility that converts all BUILD statements in the source directory from BUILD ON * to BUILD ON “membername”. This utility is used when converting from a NON-SSI environment to a SSI environment.

CA VM:Director 3.0 enhancements

Changes to Existing Features

- The ADDENTRY command syntax has been changed to support the addition of a SUBCONFIG into the directory.
- The QUERY command has been updated to add an SSI parameter

CA VM:Spool Version 1.8 enhancements

Single System Image Support

- CA VM:Spool can run in an SSI complex. We recommend all CA VM:Spool service virtual machines to be installed as an IDENTITY user on each member of the complex where CA VM:Spool functionality is required. Spool files from other systems can be accessed from CA VM:Spool screens as long as the user that the spool files belong to is logged on the system.
- However, during the backup and accounting operations, the CA VM:Spool service virtual machine only works with spool files that originated on the system where the service virtual machine runs.

CA VM:Spool Version 1.8 enhancements

New Close Date and Close Time Selection Criteria

- CA VM:Spool r1.6 SP3 introduces two new spool file selection criteria to VM:Spool, Close Date and Close Time, representing the date and time a spool file was closed. Close Date and Close Time can now be used as criterion for listing, purging, sorting, cataloging, manipulating, backing-up, and restoring spool files.
- As a result of adding Close Date and Close Time criteria the following additions have been made:
- Two new fields, Close Dt and Close Tm, have been added to the SPOOLIST, SPOOLALL, SPOOLSEL, and SELECTS screens.
- Two new REXX variables, vml.closedt and vml.closetm, have been added to the variable list used with the GETLINE macro primitive and can now be specified in VM:Spool user macros.
- Two new tokens, closedate and closetime, have been added for use with the Purge User Exit.
- In addition, for clarification, column labels for open date and open time have been changed from Date and Time to Open Dt and Open Tm, respectively.

CA VM:Spool Version 1.8 enhancements

Values of Close Date and Close Time

- If a spool file is open, the Close Dt and Close Tm values will display as blanks.
- When CA VM:Spool is reading the CP spool file blocks during SPOOLIST, SPOOLALL, and backup processing of spool files that are currently on the system, it is assumed that spool files having a Close Date and Close Time of binary zeros were open at the time of a system crash. These spool files will acquire the last IPL date and time as their Close Date and Time. CA VM:Spool does not overwrite this information in CP's spool file blocks. For example, if DISKACNT has spool files open at a time the system crashes, after the system is re-IPLed a list of those files will show the last IPL date and time as their close date and time. In addition, the Close Date and Close Time for those files will be written as the last IPL date and time in the catalog during backup processing.

CA VM:Spool Version 1.8 enhancements

Logical Record Length (LRECL) Changes

- Logical record length (LRECL) of several VM:Spool system files have been increased.

– File	Old LRECL	New LRECL
– CATALOG	160	176
– REQACTIV	160	176
– REQUESTS	160	176
– SELECTS	136	152
– SNAPSHOT	160	176

CA VM:Spool w VSEG Version 1.7 enhancements

Single System Image Support

- CA VM:Spool V/SEG-PLUS Feature can run in an SSI complex. We recommend all V/SEG-PLUS service virtual machines to be installed as an IDENTITY user on each member of the complex where V/SEG functionality is required. Spool files from other systems can be accessed from V/SEG screens as long as the user that the spool files belong to is logged on the system.

Linux and DCSS

- If a Linux guest uses discontinuous saved segments (DCSSs) and is to be relocated to another member of the SSI complex the same DCSS must exist on that system otherwise live guest relocation is not possible. The SPDISK utility of V/SEG-PLUS can be used to back up a DCSS used by Linux and restore it on another SSI member.

The UNPURGER Service Virtual Machine

- SSI copy files can now be unpurged. To support this feature an UNPURGER SVM must be running on all members of the SSI complex. When an SSI copy file is purged it is transferred to the UNPURGER SVM on the SSI member where the spool file originated from. Spool files that were unpurged can only be restored on their respective system of origin.

Roadmap Overview

- Day One support for future z/VM and Linux on System z distributions
- Continued exploitation of z/VM Single System Image
- Deliver additional products in IBM VMSES/E format in support of CA's Next-Generation Mainframe Management strategy
 - CA Dynam/T Tape Management for z/VM
 - CA VM:XMENU
 - CA VTERM
 - CA Top Secret and CA ACF2
- Deliver enhancements to improve Linux guest management and as a foundation for Cloud solutions
- Deliver enhancements in response to customer demand

Improve capability to manage Linux on System z guests

- Integration of zVPS and UPSTREAM for Linux on System z with CA VM:Manager Suite to enhance management of z/VM and Linux on System z environments
 - modernize the user interfaces
 - simplify reporting capabilities
 - Automate and simplify Linux on System z provisioning
- CA VM:Operator enhancements to allow simpler and more secure automated management of Linux on System z guests
