Trademarks

The following are trademarks of the International Business Machines Corporation in the United States, other countries, or both.

Not all common law marks used by IBM are listed on this page. Failure of a mark to appear does not mean that IBM does not use the mark nor does it mean that the product is not actively marketed or is not significant within its relevant market. Those trademarks followed by ® are registered trademarks of IBM in the United States; all others are trademarks or common law marks of IBM in the United States.

*, AS/400®, e business (logo)®, DBE, ESCO, eServer, FICON, IBM®, IBM (logo)®, iSeries®, MVS, OS/390®, pSeries®, RS/6000®, S/30, VM/ESA®, VSE/ESA, WebSphere®, xSeries®, z/OS®, zSeries®, z/VM®, System i, System i5, System p, System p5, System x, System z, System z9®, BladeCenter®

For a complete list of IBM Trademarks, see www.ibm.com/legal/copytrade.shtml

The following are trademarks or registered trademarks of other companies.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

* All other products may be trademarks or registered trademarks of their respective companies.

Notes:

IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.

All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the Performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Agenda

- Introduction to FCP on System z
- FCP with Linux on System z
- IPL over FCP
- SCSI dump
- Multipathing
 - Multipathing for root file system
- NPIV

FCP in a Nutshell

- Storage Area Networks (SANs) are specialized networks dedicated to the transport of mass storage data
- Today the most common SAN technology used is Fibre Channel Protocol (FCP)
- With this technology the SCSI protocol is used to address and transfer raw data between the servers and the storage device
- Each server is equipped with a least one adapter which provides the physical connection to the SAN
- For System z any supported FCP adapter, such as FICON Express or FICON Express2 can be used for this purpose.
- The Fibre Channel (FC) standard was developed by the National Committee of Information Technology Standards (NCITS)

Why FCP?

- Performance advantages
 - concurrent I/O to same device
 - no ECKD emulation/ no FICON protocol
- No disk size restrictions
- Up to 15 partitions (16 minor numbers per device)
- SCSI disks do not waste disk space (no low-level formatting)
- System z integration in existing FC SANs
- Use of existing FICON infrastructure
 - FICON Express adapter cards
 - FC switches / Cabling
 - Storage subsystems
- Dynamic configuration
 - Adding of new storage subsystems possible without IOCDs change
- Does NOT require more CPU than FICON

SAN topologies and System z

point-to-point

direct attached
arbitrated loop

not supported

switched fabric

FCP channel and subchannel

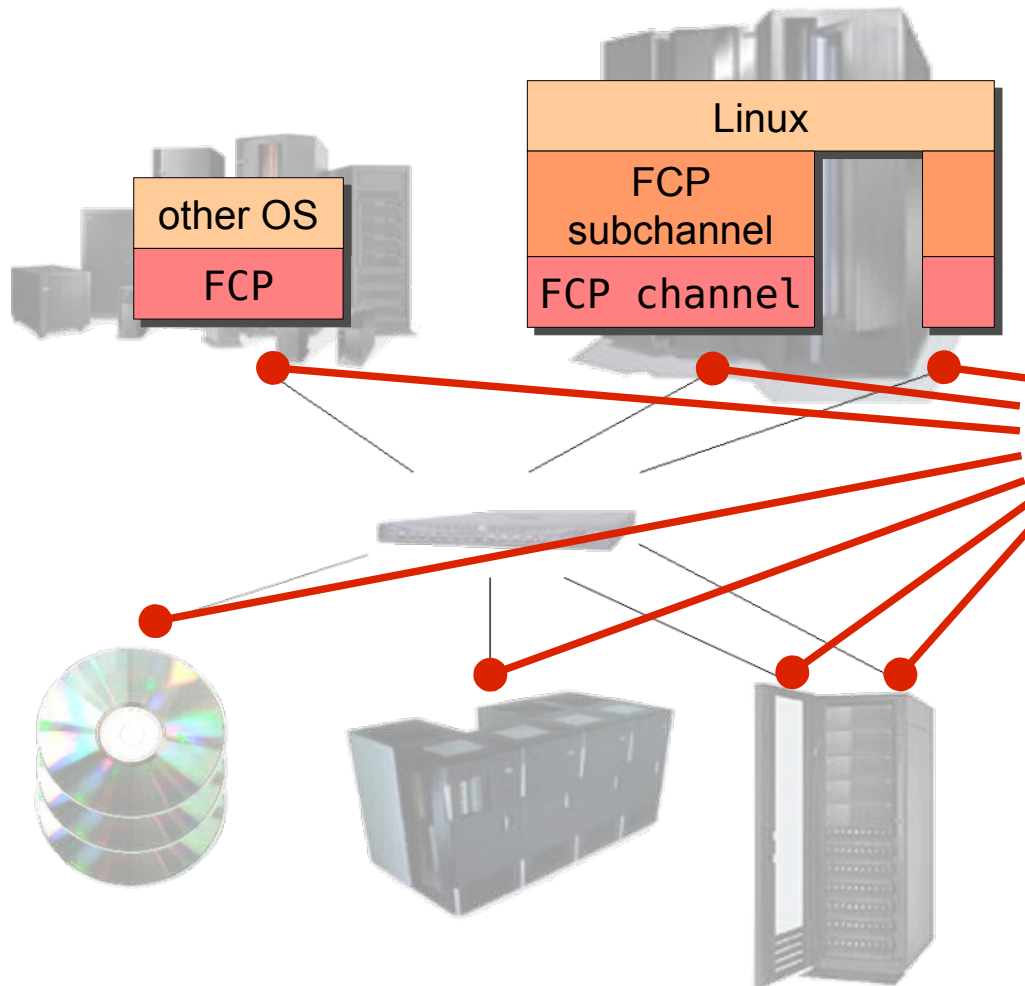

Linux connects through **FCP subchannels** to FCP attached storage.

A subchannel is identified - in Linux - by its **bus identifier** which is derived from the subchannel's **device number**.

sample FCP subchannel (as seen in Linux):
`/sys/bus/ccw/drivers/zfcp/0.0.1900`

World Wide Port Names (WWPNs)

Storage devices and servers attach through Fibre Channel ports (called N_Ports).

An N_Port is identified by its **World-Wide Port Name (WWPN)**.

For redundancy, servers or storage may attach through several N_Ports.

sample WWPN:
0x5005076303000104

Logical Unit Numbers (LUNs)

Storage devices usually comprise many logical units (volumes, tape drives, ...).

A logical unit is identified by its

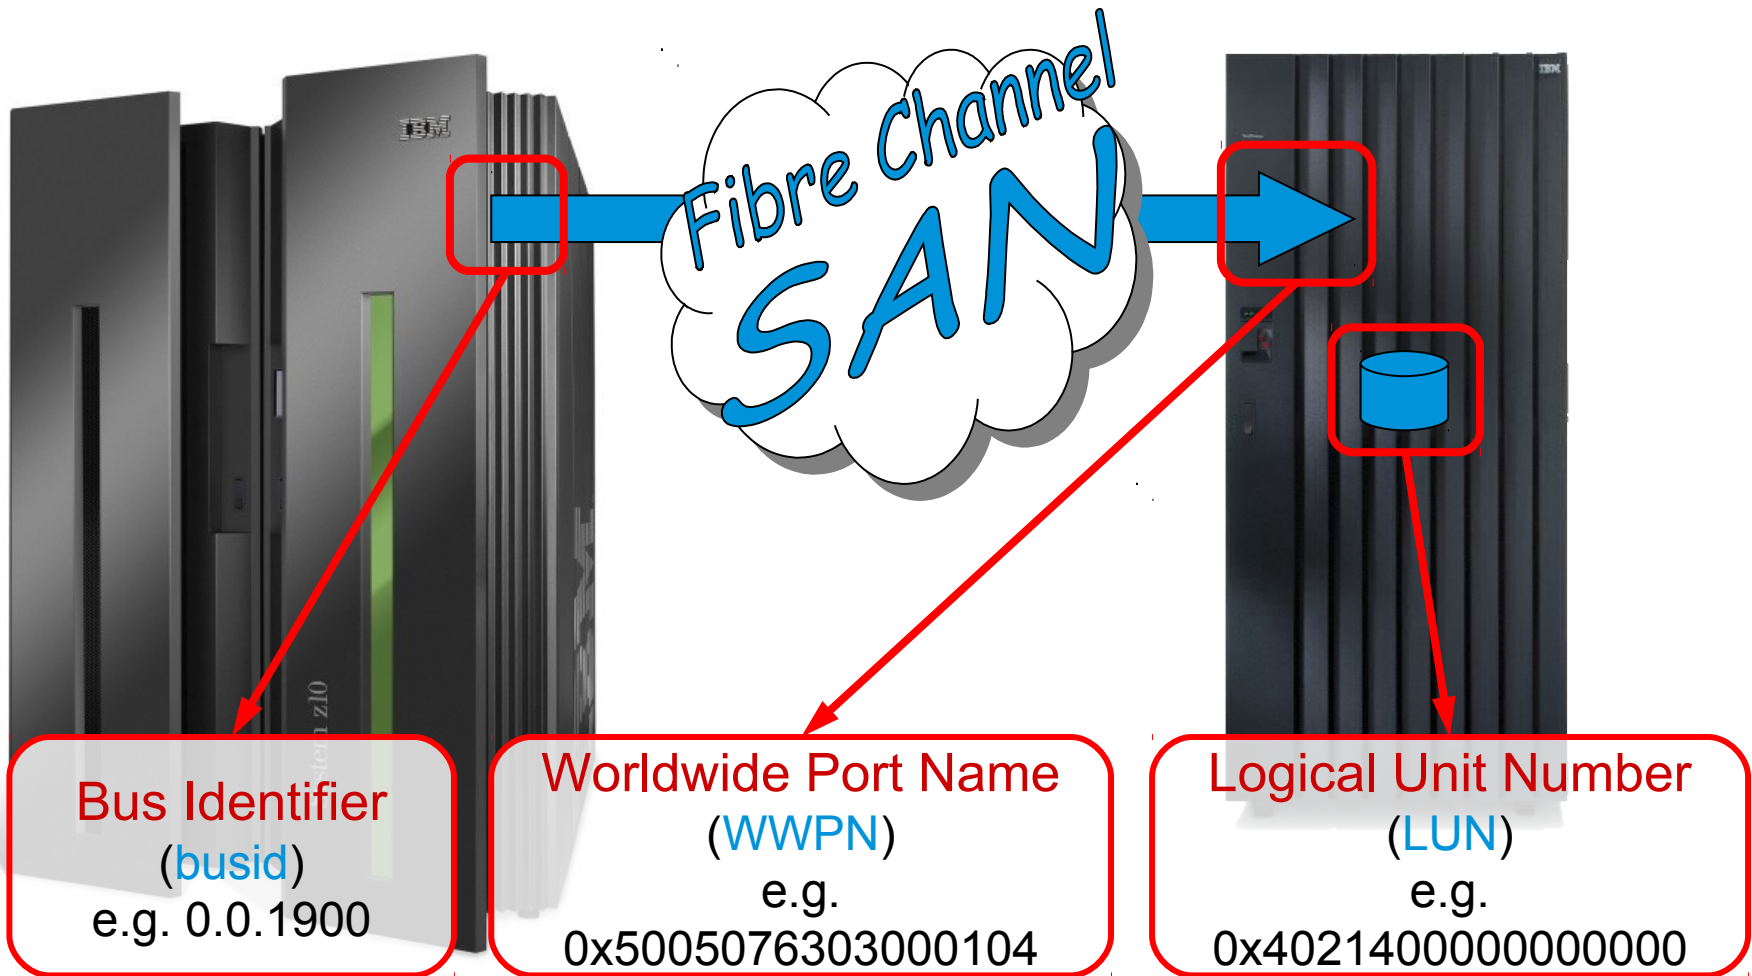

**Fibre Channel Protocol
Logical Unit Number
(FCP LUN).**

sample FCP LUN:

0x4021400000000000

Beware of LUN translation!

Navigating in a SAN

SCSI compared to Channel I/O

■ SCSI / FCP

- adapter defined in System z I/O configuration
- Ports and LUNs attachment handled in Operating Systems
- Multipathing handled in Operating System
- No disk size restrictions for SCSI disks
- Additional configuration outside System z necessary
 - Zoning in the SAN fabric
 - LUN masking on the storage server

■ Channel I/O

- device defined in System z I/O configuration
- Ports attachment handled in System z I/O config
- Multipathing handled in System z firmware
- Disk size restrictions to Mod 54 / Mod 224
- Switch configuration via System z I/O config

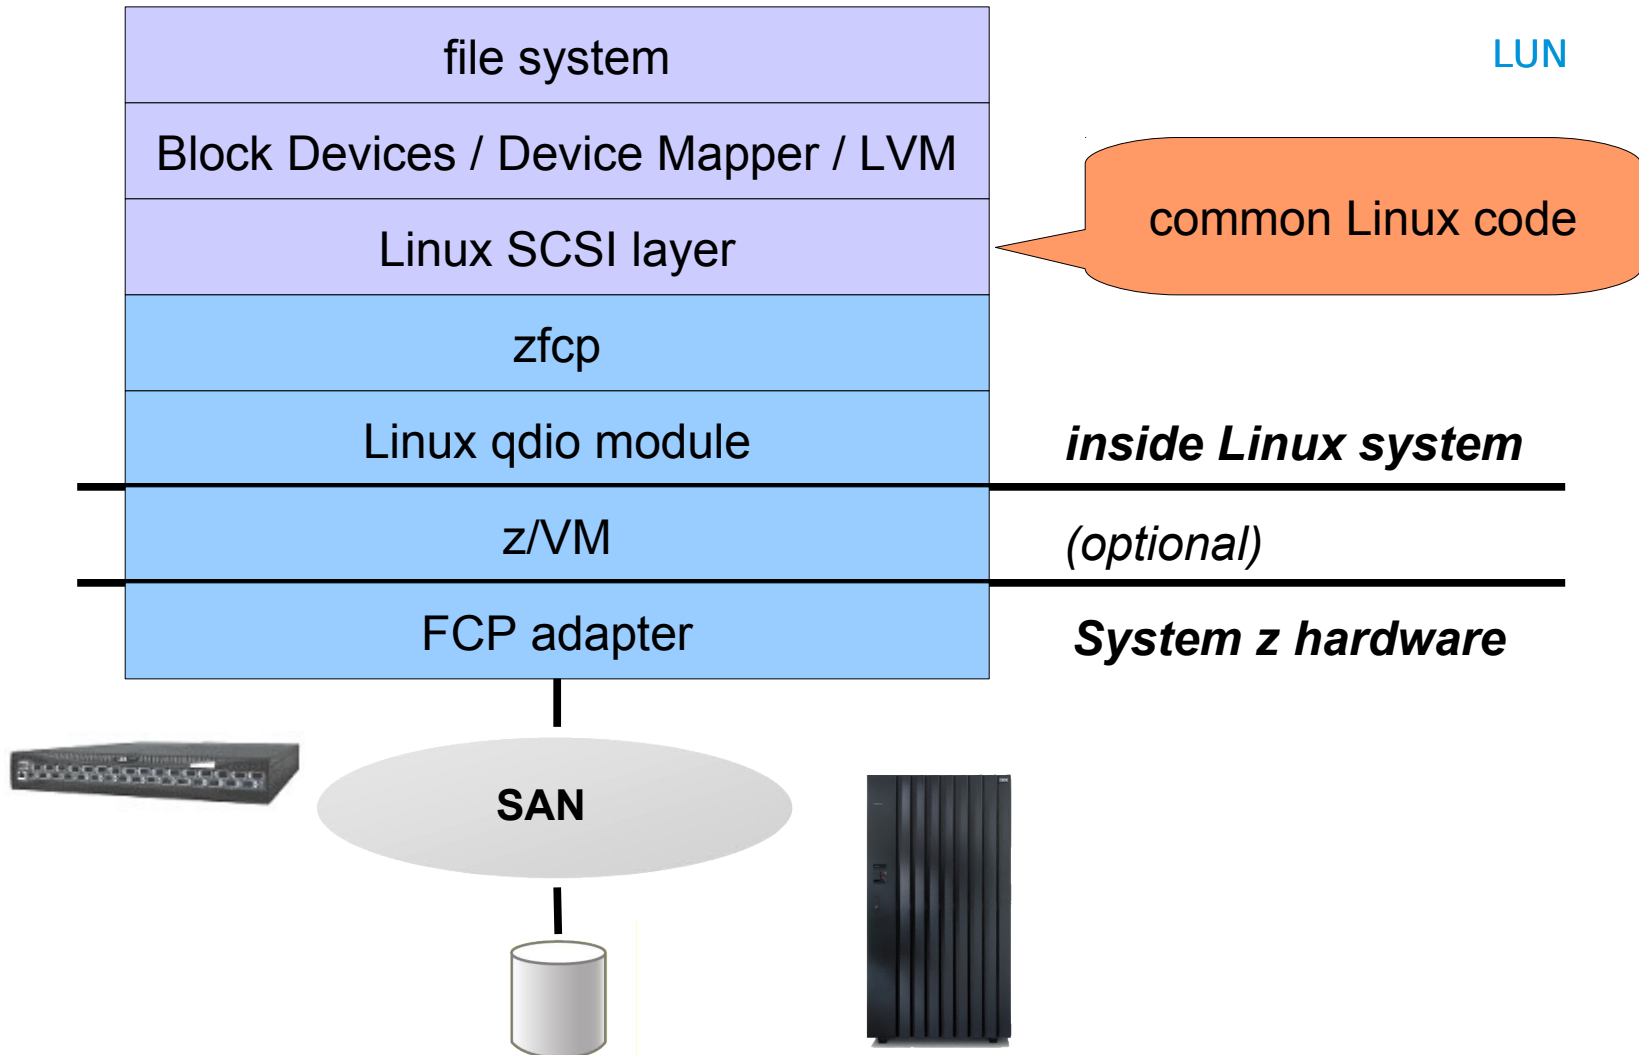

zfc: Getting started

- Configure a Fibre Channel host adapter within the mainframe (I/O Definition File).
- Configure zoning for the Fibre Channel host adapter to gain access to desired target ports within a SAN.
 - Segmentation of a switched fabric is achieved through zoning. It can be used to partition off certain portions of the switched fabric, allowing only the members of a zone to communicate with that zone.
- Configure LUN masking for the Fibre Channel host adapter at the target device to gain access to desired LUNs.
 - A LUN represents a portion of a controller, such as a disk device. With the use of LUNs, a controller can be logically divided into independent partitions. Access to these LUNs can be restricted to distinctive WWPNs as part of the controller configuration
- In Linux, configure target ports and LUNs of the SCSI device at the target port for use of zfc.
- Note: If the Fibre Channel host adapter is directly attached to a target device (point-to-point connection), step 2 is not needed.

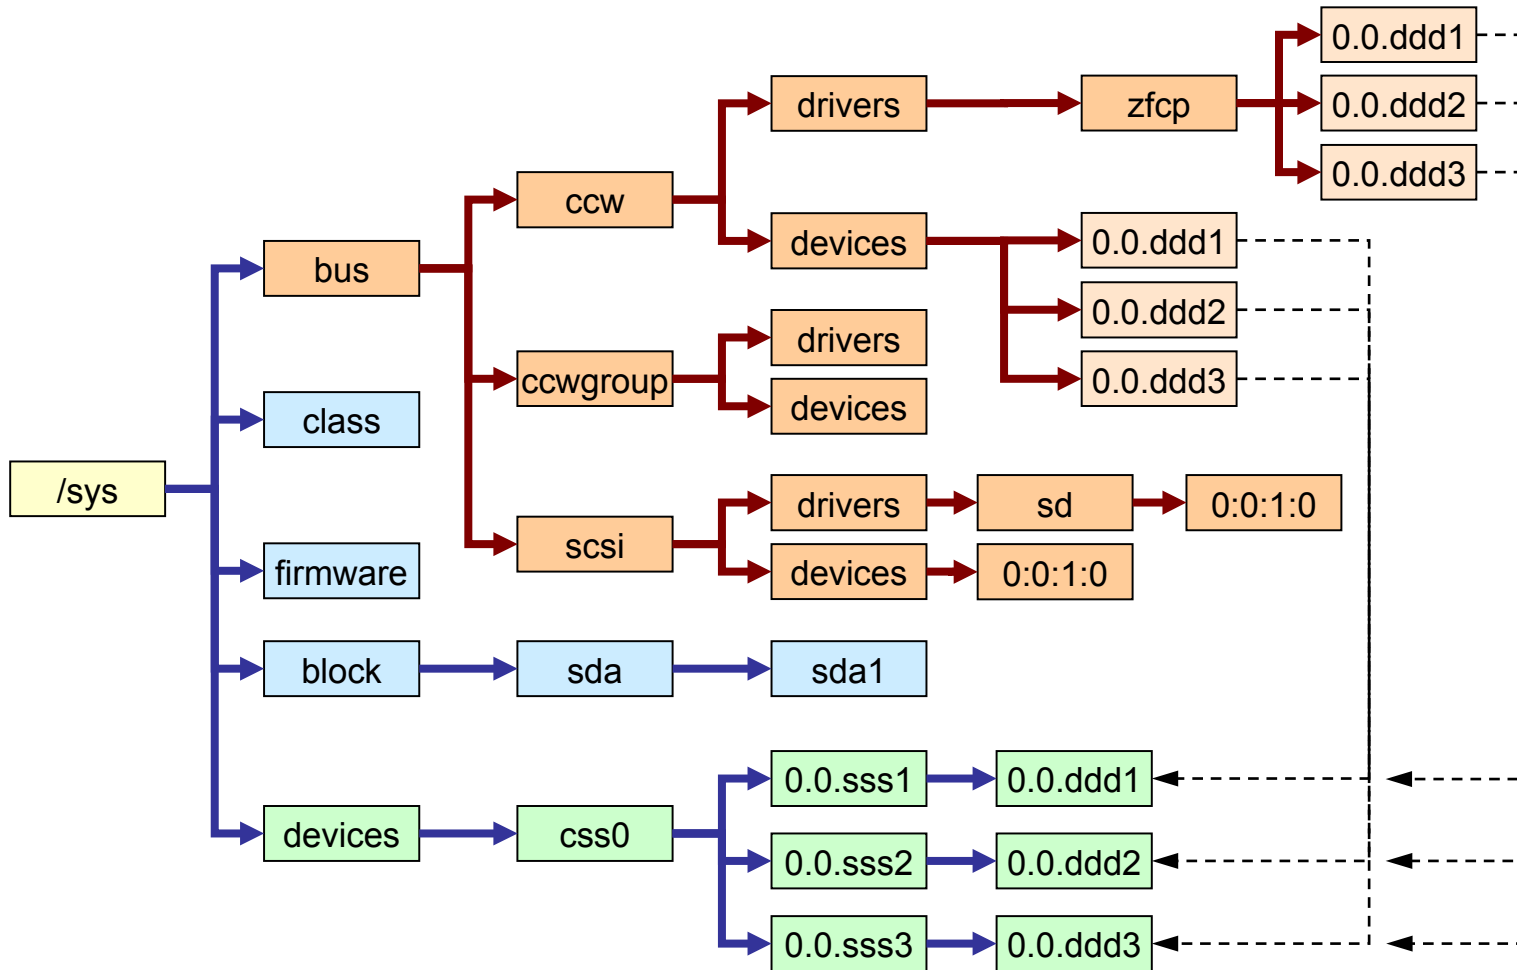

Hardware: Define FCP adapter in IOCDs

```

```

I/O stack for SCSI and Linux

Sysfs

zfcpl: Configuration

```
# chccwdev -e 0.0.1900
```

```
# cat /var/log/messages
```

```
zfcpl: The adapter 0.0.1900 reported the following characteristics:
```

```
WWNN 0x5005076400c3c03f, WWPN 0x5005076401a28753, S_ID 0x00687700,
```

```
adapter version 0x4, LIC version 0xb02, FC link speed 4 Gb/s
```

```
zfcpl: Switched fabric fibrechannel network detected at adapter 0.0.1900.
```

```
# cd /sys/bus/ccw/drivers/zfcpl/0.0.1900/
```

FCP adapter

Target WWPN

```
# echo 0x5005076303000104 > port_add
```

```
# echo 0x4021400000000000 > 0x5005076303000104/unit_add
```

Not required when using SLES11
due to auto port scanning

Lun

```
# cat /var/log/messages
```

```
zfcpl: Switched fabric fibrechannel network detected at adapter 0.0.1900.
```

```
Vendor: IBM      Model: 2107900      Rev: 1.50
```

```
Type: Direct-Access      ANSI SCSI revision: 05
```

```
scsi 0:0:0:1: Attached scsi generic sg0 type 0
```

```
SCSI device sda: 10485760 512-byte hdwr sectors (5369 MB) .....
```

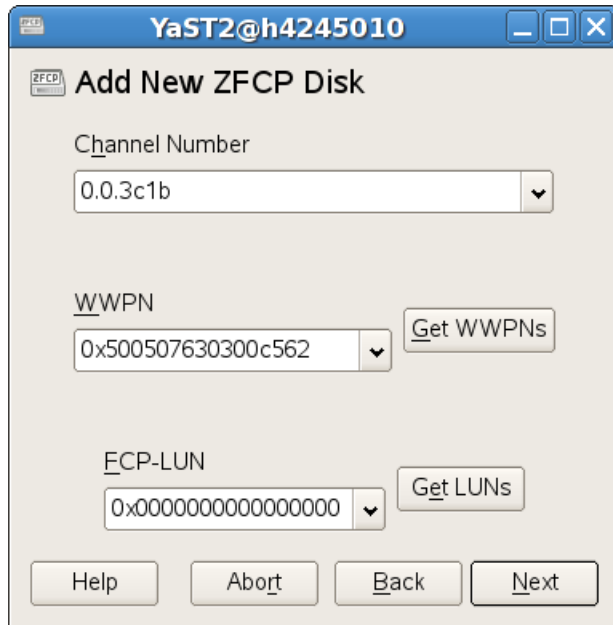

zfcplib: Configuration (cont'd)

```
# lszfcp -D
0.0.1900/0x5005076303000104/0x4021400000000000 0:0:0:1
# lsscsi
[0:0:0:1] disk IBM 2107900 1.50 /dev/sda
```

Manually disabling a scsi device from current configuration

```
# echo 1 > /sys/bus/scsi/devices/0:0:0:1/delete
# echo 0x4021400000000000
  > /sys/bus/ccw/drivers/zfcplib/0.0.1900/0x5005076303000104/unit_remove
# echo 0x5005076303000104
  > /sys/bus/ccw/drivers/zfcplib/0.0.1900/port_remove
# chccwdev -d 1900
```

SLES: GUI-Setup

- zfcplib dialog in YaST simplifies setup of SAN attached devices
- Auto detects available FCP subchannels, WWPNs, and LUNs
- *copy&paste* WWPNs and FCP_LUNs from configuration file obtained from SAN management tools or administrator

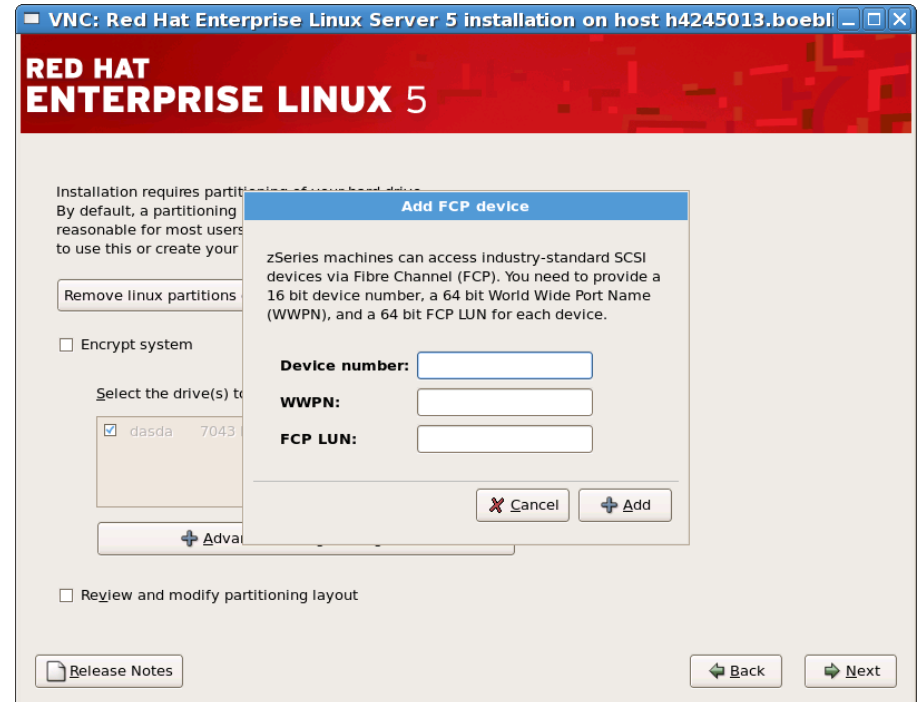

- alternatively on command line

- SLES 10: /etc/sysconfig/hardware/hwcfg-zfcplib-bus-ccw-0.0.*
- SLES 11: zfcplib_{host|disk}_configure → /etc/udev/rules.d/51-zfcplib-0.0.*.rules

RHEL: GUI-Setup

- Ignore subsequent complaints in case of DASD-less system.
- GUI only available during installation. Later define FCP devices in `/etc/zfcp.conf` for permanent addition.

```
# cat /etc/zfcp.conf
0.0.170e 0x5005076300c18154 0x4010402000000000
# cat /etc/modprobe.conf
[...]
alias scsi_hostadapter zfcp
# /sbin/zfcpconf.sh
```

zfcplib: toolchain

■ lsscsi

- Uses information in `sysfs` to list scsi devices (or hosts) currently attached to the system

```
[0:0:0:0]disk IBM 2107900 1.50 /dev/sda
```

■ lszfcp

- `lszfcp` provides information contained in `sysfs` about zfcplib adapters, ports and units and its associated `scsi_hosts`, `fc_hosts`, `fc_remote_ports` and `scsi_devices`.
- The default is to list busids of all zfcplib adapters and their corresponding SCSI host name

```
# lszfcp -H                                shows information about hosts
0.0.170e host0

# lszfcp -P                                shows information about ports
0.0.170e/0x500507630300c562 rport-0:0-0

# lszfcp -D                                shows information about SCSI devices
0.0.170e/0x500507630300c562/0x4010402000000000 0:0:0:0
```

zfc: SCSI Disk Usage

```
# fdisk /dev/sda
```

```
Command (m for help): p
```

```
Disk /dev/sda: 5368 MB, 5368709120 bytes
```

```
166 heads, 62 sectors/track, 1018 cylinders
```

```
Units = cylinders of 10292 * 512 = 5269504 bytes
```

Device	Boot	Start	End	Blocks	Id	System
/dev/sda1		1	1018	5238597	83	Linux

```
# mke2fs -j /dev/sda1
```

FCP Multipathing

2 paths to disk through independent FCP adapters and independent controllers.

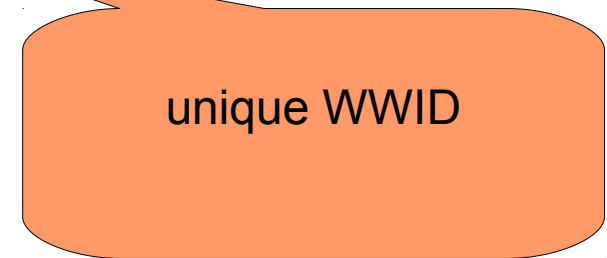

Multipathing for disks

- Multipathing is mandatory for FCP-attached SCSI disks
- In general there are two reasons for establishing multiple paths to a device
 - failover and failback capabilities for high availability
 - each controller or node might be unavailable
 - hardware maintenance
 - microcode updates
 - internal resets
 - load balancing for high performance (throughput)
 - spread I/O load across available paths
- device-mapper (kernel) multipathing
 - Included with standard distributions (SLES and RHEL)
 - supports more than 2 paths
- multipathd daemon
 - reads configuration and establishes setup
 - identifies and groups available paths automatically
 - reestablishes paths (failback)
 - checks paths periodically
- multipath tool that allows the user to configure and manage multipathed devices.
- kpartx for partitions on multipath devices

Multipathing for disks - Linux device mapper

The device mapper creates one block device for the LUN `/dev/mapper/xxx`

`/dev/mapper/36005076303ffc56200000000000010cc`

(World-Wide Identifier) from storage server identifies volume

zfcplib setup for multipathing

- Have multiple paths to one disk
- Avoid shared components in different paths

```
# cd /sys/bus/ccw/drivers/zfcplib/  
# echo 1 > 0.0.3c00/online  
# echo 1 > 0.0.3d00/online  
# echo 0x500507630313c562 > 0.0.3c00/port_add  
# echo 0x500507630303c562 > 0.0.3d00/port_add  
# echo 0x401040cc00000000 > 0.0.3c00/0x500507630313c562/unit_add  
# echo 0x401040cc00000000 > 0.0.3d00/0x500507630303c562/unit_add
```

usually same
FCP LUN (check
on storage server)

different adapters and
different ports to avoid
single points of failures

zfcplib setup for multipathing (cont'd)

- zfcplib and SCSI report each path as device
- multipathing happens on higher layer

```
# ls SCSI
[0:0:0:0] disk IBM 2107900 2.27 /dev/sda
[1:0:1:0] disk IBM 2107900 2.27 /dev/sdb
# ls zfcplib -D
0.0.3c00/0x500507630313c562/0x401040cc00000000 0:0:0:0
0.0.3d00/0x500507630303c562/0x401040cc00000000 1:0:1:0
```

Multipathing for disks - SLES 10 and SLES 11

- add all paths to system
 - YaST or edit `/etc/sysconfig/hardware/hwcfg-zfcp-*` (SLES 10)
 - `hwup zfcp-bus-ccw-0.0.3c00`
 - `zfcp_{host|disk}_configure` (SLES 11)
- `cp /usr/share/doc/packages/multipath-tools/multipath.conf.synthetic /etc/multipath.conf`
 - Make sure there is an appropriate device entry for your SAN
- enable device scanning and `multipathd`
 - `chkconfig multipathd on`
 - `chkconfig boot.multipath on`
- reboot or manually start multipath scripts
 - `/etc/init.d/boot.multipath start`
 - `/etc/init.d/multipath start`

Multipathing for disks - RHEL5

- attach all paths to system
 - /etc/zfcp.conf
 - /sbin/zfcpconf.sh or reboot
- Adjust /etc/multipath.conf
- chkconfig --add multipathd
- /etc/init.d/multipathd start
- user_friendly_names and aliases
 - /dev/mapper/mpath0 instead of /dev/mapper/36005076303ffc562000000000000010c
 - e
- But: WWID is unique, alias maybe not
 - mapping depends on config file
- Recommendation: Use WWIDs

```
# cat /etc/multipath.conf
...
blacklist {
    devnode  "^(ram|raw|loop|fd|md|dm-|sr|scd|st) [0-9]*"
    devnode  "^hd[a-z] [[0-9]*]"
    devnode  "^cciss!c[0-9]d[0-9]*[p[0-9]*]"
    devnode  "^dasd[a-z]+[0-9]*"
}
...
```

DM multipathing status

WWID for volume

```
# multipath -ll
36005076303ffc56200000000000010cf dm-0 IBM,2107900
[size=5.0G][features=1 queue_if_no_path][hwhandler=0]
\_ round-robin 0 [prio=2][active]
\_ 1:0:0:0 sdb 8:16 [active][ready]
\_ 0:0:0:0 sda 8:0 [active][ready]
```

pathgroup

Device to work with: /dev/mapper/36005076303ffc56200000000000010cf

- No config file necessary to get started
- Defaults are good for availability
 - Storage Controller specific settings used as defaults
 - can be overwritten e.g. for load balancing

Multipathing - policies

- failover
 - First path is used as long as it is available – no failback
 - Recommended for DS8000
 - consider load balancing during configuration
- multibus / round robin
 - All paths are used alternatively at same priority
 - Round robin parameter adjustable
 - May imply congestion on selected paths.
- group_by_prio
 - A priority_callout is used to determine priority of each path
 - Default for DS6000 preferred pathing (via ALUA callout)
 - Can be (ab)used for load distribution

Root Filesystem on Multipath

Required for root filesystem on SCSI disk

Multipath setup has to be available early from initrd

Starting with RHEL 5.2 and SLES 11

installers support install on multipath device

Partly requires special boot flags in parm file on IPL of installer

→ please see distro documentation on installation and multipath storage

Issues:

For older distros, where installers don't support install on multipath device:

install on single path and change setup later

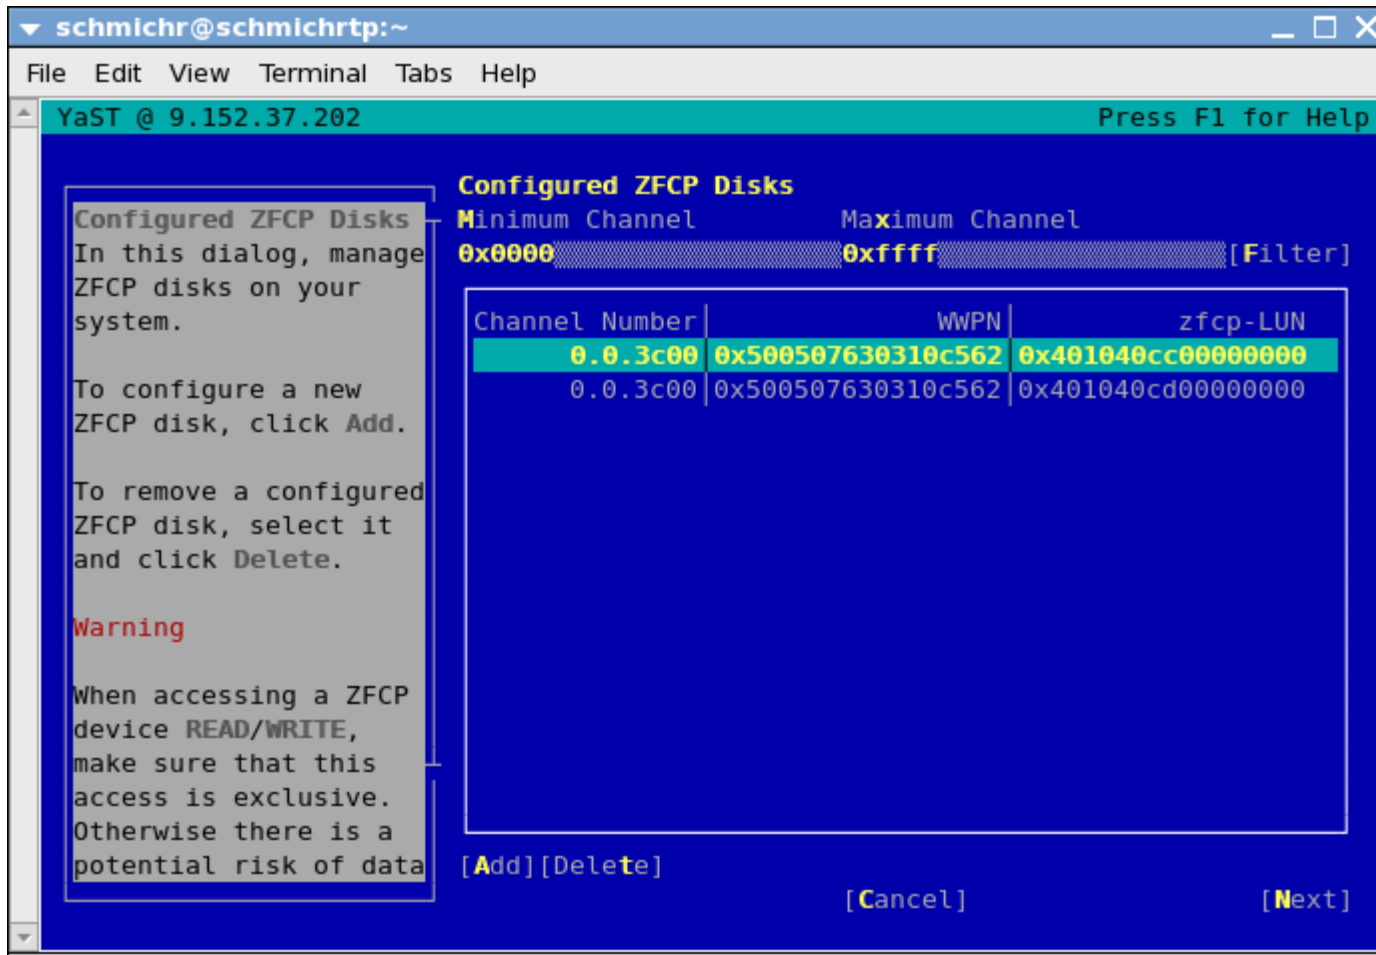

zipl does not work on multipath device

Use additional single-path device for /boot

(SCSI or DASD)

Example: Install SLES10 on multipath root

2 devices for / and /boot

Example: Install SLES10 on multipath root

/, /boot and swap filesystems

```

Expert Partitioner

For a root file system
on SCSI disks, add a
/boot partition on
DASD to use for IPL.

The table to the right
shows the current
partitions on all your
hard disks. Nothing
will be written to
your hard disk until
you confirm the entire
installation in the
last installation
dialog. Until that
point, you can safely
abort the
installation.

Hard disks are
designated like this:

Device  ID  Size  F  Type  Mount  Mount By
-----  --  ---  -  ---  ---    ---
/dev/sda  ()  5.0 GB  F  IBM-2107900
/dev/sda1  4.0 GB  F  Linux native (Ext3)  /  I
/dev/sda2  1011.9 MB  F  Linux swap  swap  I
/dev/sdb  ()  5.0 GB  F  IBM-2107900
/dev/sdb1  4.9 GB  F  Linux native (Ext3)  /boot  I

[Create][Edit][Delete][dasdfmt]
[LVM...] [EVMS...] [RAID...v] [NFS...] [Expert..v]
[ Back ] [Abort] [Finish]

```

Example: Install SLES10 on multipath root

initial boot via disk for /boot

```

SCSI IPL

- The traditional initial program load (IPL) process relies on accessing a device using System z channel attachment
- For IPL from a FCP-attached device, this is not possible
- SCSI IPL expands the set of IPL'able devices
 - SCSI disks as Linux boot file system possible
- New set of IPL parameters
- Requires to address the SCSI disk
 - FCP adapter id
 - Remote port
 - LUN
- LPAR and z/VM guests supported
- SCSI (IPL) with z/VM
 - z/VM Version 4.4 (PTF UM30989) or newer
 - z/VM Version 5.3 (current version)

SCSI-IPL example LPAR

LNXHMC5: Load - Iceweasel

SCSI dump

- Dump memory of one LPAR to disk for problem analysis
- Similar to VMDUMP and dump to DASD
- SCSI dump supported for LPARs and as of z/VM 5.4
- Preparation summary:
 - large SCSI disk (at least system memory + 11 MB)
 - `fdisk /dev/sda`
 - `mke2fs /dev/sda1`
 - `mount /dev/sda1 /mnt`
 - `zipl -D /dev/sda1 -t /mnt`
 - `umount /mnt`

SCSI dump from HMC

- Select CPC image for LPAR to dump
- Goto Load panel
- Issue SCSI dump
 - FCP device ID
 - WWPN
 - LUN

The screenshot shows the 'Load' panel in the HMC interface. The 'Load type' is set to 'SCSI dump'. The 'Load address' is '4B49'. The 'Time-out value' is '60' seconds. The 'Worldwide port name' is '5005076305194786'. The 'Logical unit number' is '40FB400300000000'. The 'Boot program selector' is '0'. The 'Boot record logical block address' is '0'. The 'Operating system specific load parameters' field is empty. The 'OK', 'Reset', 'Cancel', and 'Help' buttons are visible at the bottom.

Load	
CPC:	T63
Image:	T63LP22
Load type	<input type="radio"/> Normal <input type="radio"/> Clear <input type="radio"/> SCSI <input checked="" type="radio"/> SCSI dump
<input type="checkbox"/> Store status	
Load address	*4B49
Load parameter	
Time-out value	60 <input type="button" value="▲"/> <input type="button" value="▼"/> 60 to 600 seconds
Worldwide port name	5005076305194786
Logical unit number	40FB400300000000
Boot program selector	0
Boot record logical block address	0
Operating system specific load parameters

SCSI dump under z/VM

- SCSI dump from z/VM is supported as of z/VM 5.4
- Issue SCSI dump

```
#cp cpu all stop
```

```
#cp cpu 0 store status
```

```
#cp set dumpdev portname 47120763 00ce93a7 lun 40104020  
00000000 bootprog 0
```

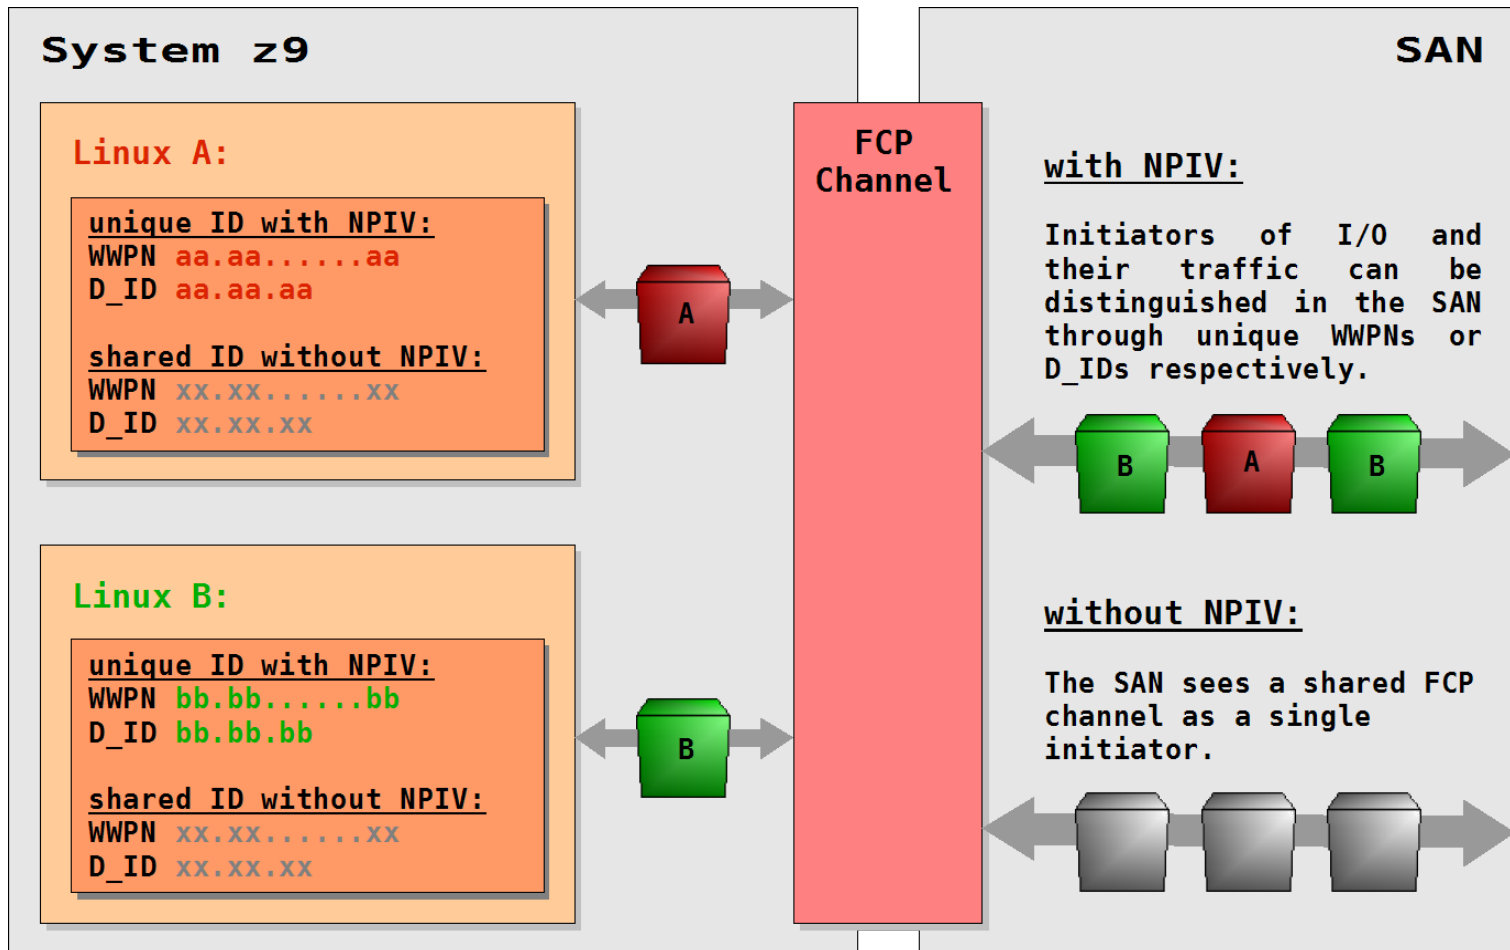

```
#cp ipl 4b49 dump
```

- To access the dump, mount the dump partition

NPIV

- N_Port Identifier Virtualization (NPIV) is a Fibre Channel facility allowing multiple WWPNs to share a single physical WWPN.
 - without NPIV: one WWPN for FCP channel
 - with NPIV: unique WWPN for each FCP subchannel
- enables
 - proper zoning in SAN fabrics
 - proper LUN masking in storage devices
- security
- access control

NPIV – Unique SAN Identities!

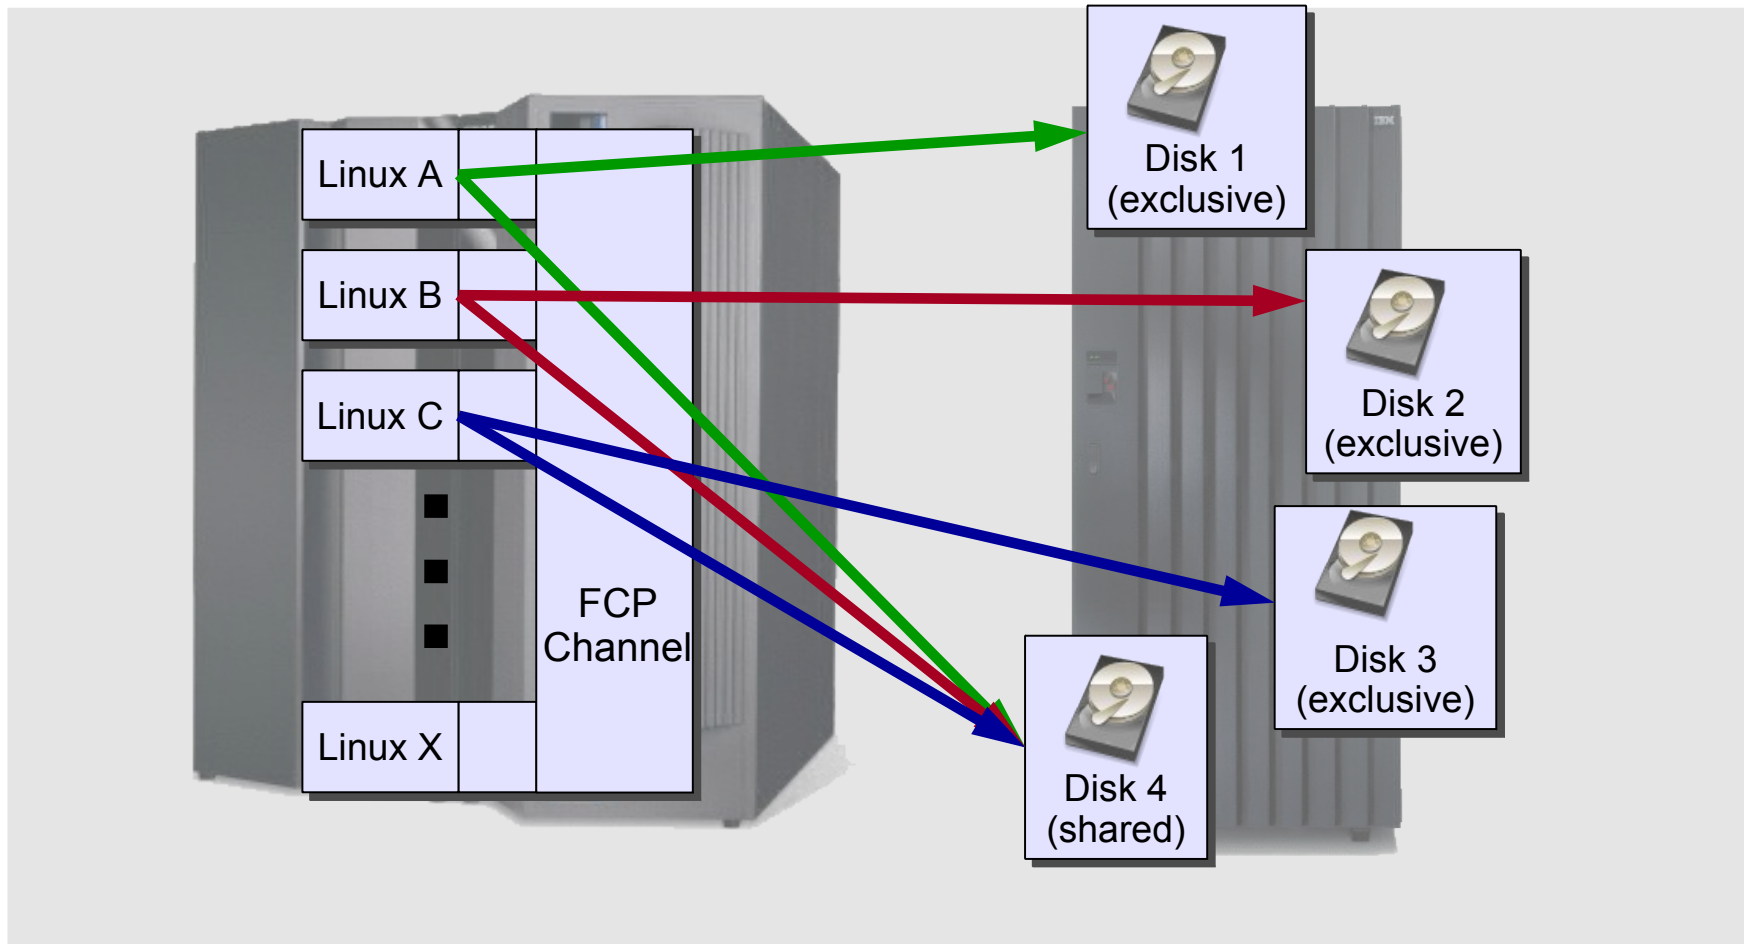

SAN zoning with NPIV

Different Linux guests in different zones

LUN masking with NPIV

Storage server can identify Linux guests via WWPNs

NPIV requirements

- NPIV is available on System z servers.
 - FICON Express 2 adapter running with MCL003 on EC J99658
- z/VM
 - z/VM 5.2 or 5.3
 - z/VM 5.1 with the PTF for APAR VM63744
- Linux Distribution
 - Currently SLES9 SP3/4, SLES10, RHEL5, SLES 11
- NPIV-Capable Switch
 - only required for switch adjacent to System z

NPIV: Do's and don'ts

- Do not use more than 32 FCP devices per physical channel in NPIV mode.
- Zone each NPIV WWPN individually. This can reduce fabric traffic.
- Multipathing remains mandatory (performance and availability).
- Enable NPIV on the SAN switch before enabling it on the System z9 server.
- Be aware that each login from a NPIV-mode FCP device into a storage subsystem counts as a separate host login. There are limits at storage side.
- Switches typically limit the number of supported N_Port IDs.
- Some switches limit the number of N_Port IDs that can be assigned to a physical port.
- FCP microcode MCL003 on EC J99658 requires a special activation procedure. All FCP PCHIDs should be configured off before activating the MCL.

Device Support

IBM I/O connectivity website

<http://www-03.ibm.com/systems/z/connectivity/products/fc.html>

<http://www-03.ibm.com/systems/support/storage/config/ssic/displayesssearchwithoutjs.wss>

Switches	Disks	Tape
IBM	IBM DS8000	IBM 3590 drive
Brocade	IBM DS6000	IBM 3592 drive
Cisco	IBM XIV	IBM 3494 libr.
CNT	IBM SVC	IBM 3584 libr.
McData		IBM TS 7510
	Vendor Disks*	Vendor Devices & libraries *

* if Vendor & Software support the attachment

Summary of FCP

- available for IBM zSeries and System z
- based on existing Fibre Channel infrastructure
- runs on all available z/VM and RHEL/SLES versions
- integrates System z into standard SANs
- connects to switched fabric or point-to-point
- multipathing for SCSI disks is mandatory
- SCSI tape is the only tape attachment supported by Backup/Archive middleware such as TSM
- gives you new storage device choices
- usually performs better than FICON
- buys you flexibility at the cost of complexity
- tooling available, receiving better integration

ECKD and SCSI Comparison

	ECKD DASD	SCSI Disk
Configuration	IOCDS/MM (operator)	IOCDS/MM & SAN & Linux (operator & SAN admin & Linux admin)
Access Method	SSCH/CCW	QDIO
Block Size (Byte)	512, 1K, 2K, 4K	512
Disk Size	3390 Model 3/9/27/54	any
Formatting (low level)	dasdfmt	not necessary
Partitioning	fdasd	fdisk
File System	mke2fs (or others)	
Access	mount

Linux on System z®

- What is Linux?
- What is Linux on System z?
- Why developerWorks pages for Linux on System z?

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

What is Linux?

Linux is an operating system whose kernel was developed by Linus Torvalds and initially distributed in 1991. Linux has evolved to become a widely accepted operating system with a wealth of applications. Today, many Linux distributions also contain a variety of tools and utilities provided by the open source community (e.g., from the GNU project). Linux is platform-independent and executes on many architectures, including IBM System z, IBM Power Systems™, Intel®, Alpha®, or Sparc®. Linux is Open Source software which means that the source code may be downloaded free of charge. You can learn more about Open Source on www.opensource.org.

Although the source code is free, only system programmers build their own distributions. For production purposes, Linux distributions built by Linux distribution partners are used.

[↑ Back to top](#)

What is Linux on System z?

Linux on System z is the synonym for Linux running on any IBM mainframe, including:

- IBM System z10™
- IBM System z9®
- IBM eServer™ zSeries™ (z990, z890, z900, z800)
- S/390® (9672 G5, G6 and Multiprise® 3000 processors).

Linux on System z exploits the strengths and reliability features of the System z hardware, while preserving the openness and stability of Linux.

For more information refer to the Linux on System z homepage at: ibm.com/systems/z/os/linux

Linux on System z distributions are offered by Linux distribution partners who provide services and support. IBM offers consulting services, defect and remote technical support for all eligible generally available distributions of Linux for System z.

Contact the IBM team

If you want to contact the Linux on System z IBM team refer to the [Contact the Linux on System z IBM team](#) page.

IBM Systems > System z > z/VM >

z/VM®

the newest VM hypervisor based on 64-bit z/Architecture.

Currently supported releases of z/VM

Available:	z/VM V5.3
Also supported:	z/VM V5.2

The z/VM hypervisor is designed to help clients extend the business value of mainframe technology across the enterprise by integrating applications and data while providing exceptional levels of availability, security, and operational ease. z/VM virtualization technology is designed to allow the capability for clients to run hundreds to thousands of Linux servers on a single mainframe running with other System z operating systems, such as z/OS, or as a large-scale Linux-only enterprise server solution. z/VM V5.3 can also help to improve productivity by hosting non-Linux workloads such as z/OS, z/VSE, and z/TPF.

Summary of News and Updates

View 03 June 2008 updates.

Read the [z/VM and VM Site News and Changes](#) for a summary of VM-related news, announcements, pointers, new classes, and places to hear about z/VM virtualization technology.

Backing up data using TSM?

- * “stand-alone” Linux backup solution, no assistance from z/OS required
- * TSM supports many SCSI tape devices, including OEM devices (System z only supports SCSI tape devices from IBM so far)
- * both TSM client and TSM server are available for Linux on System z

Multipathing for IBM tapes (1)

Multipathing for IBM tapes (2)

Multipathing for IBM tapes (3)

Multipathing provided by IBM tape device driver

lin_tape (formerly IBMtape)

Supported together with tape drive

Capable of failover and failback, no load balancing

Does not cover data mirroring

responsibility of backup and media management applications

Multipathing for IBM tapes (4)

Setup:

enable via module parameter in `/etc/modprobe.conf.local`

```
options lin_tape alternate_pathing=1
```

attach all paths to tape drive
