

# Hex, Lies and Videoblogs – Debunking Mainframe Myths

Frank J. De Gilio  
IBM

March 14, 2012  
Session: 10373

## Quick Survey: True or False?

- Mainframes expensive to buy and support.
- Mainframes are an outdated platform for enterprise applications
- All Mainframe code is in COBOL or Assembler
- The only way to get to the mainframe is a green screen.
- Mainframe people are all old and about to retire
- Mainframe technology is always behind the other platforms
- Mainframes are hard to use
- Mainframes are slow

## Quick Survey: True or False?

- Mainframes expensive to buy and support.
- Mainframes are an outdated platform for enterprise applications
- All Mainframes run in CICS
- The only way to interact with a mainframe is through a green screen.
- Mainframe people are retiring
- Mainframe technology is not as good as the other platforms
- Mainframes are still used
- Mainframes are still used

**False**

**SHARE**

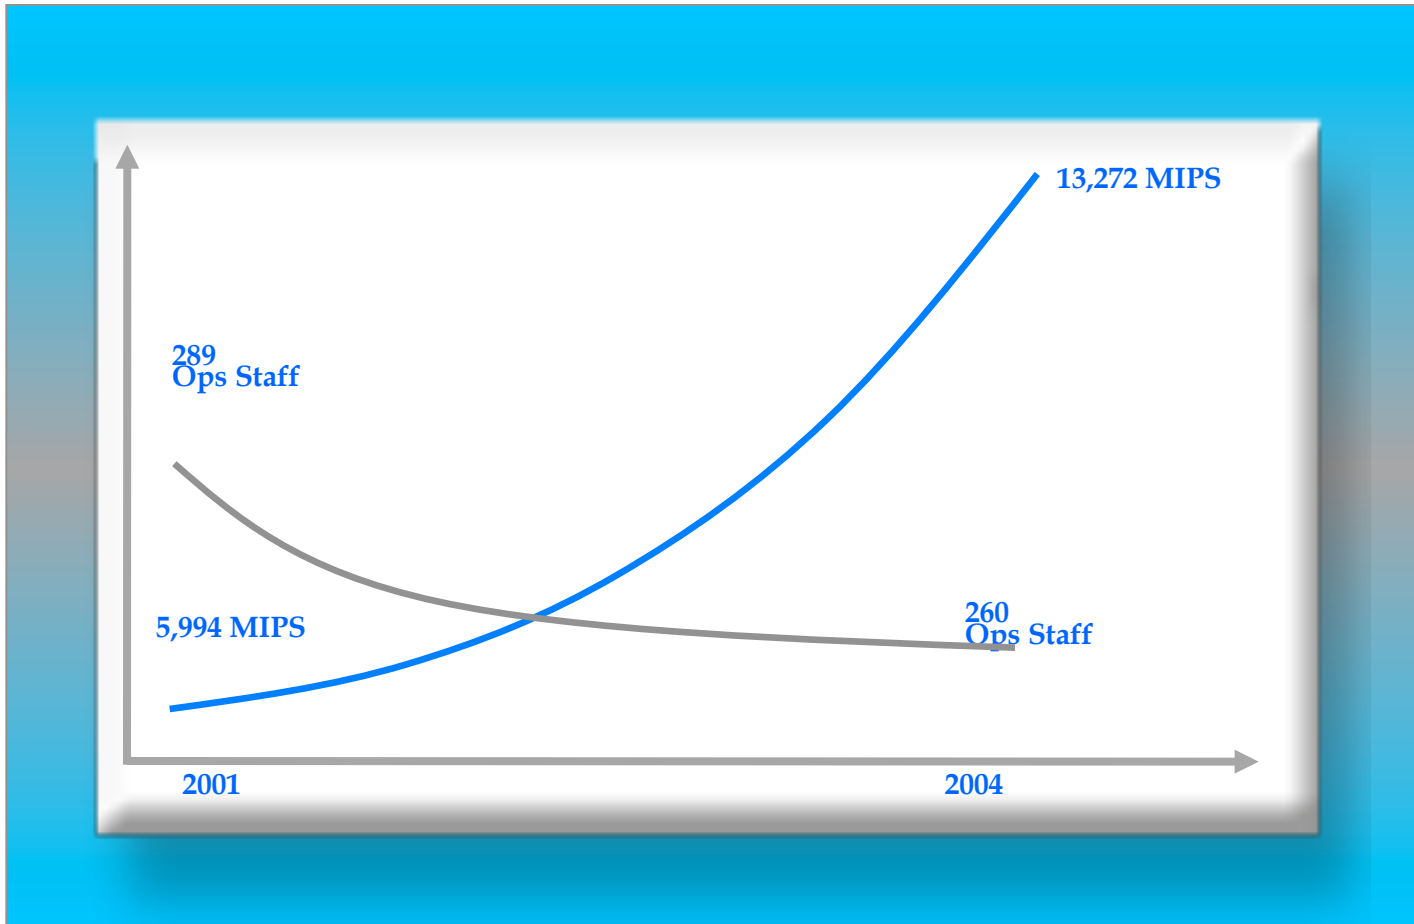

Technology • Connections • Results

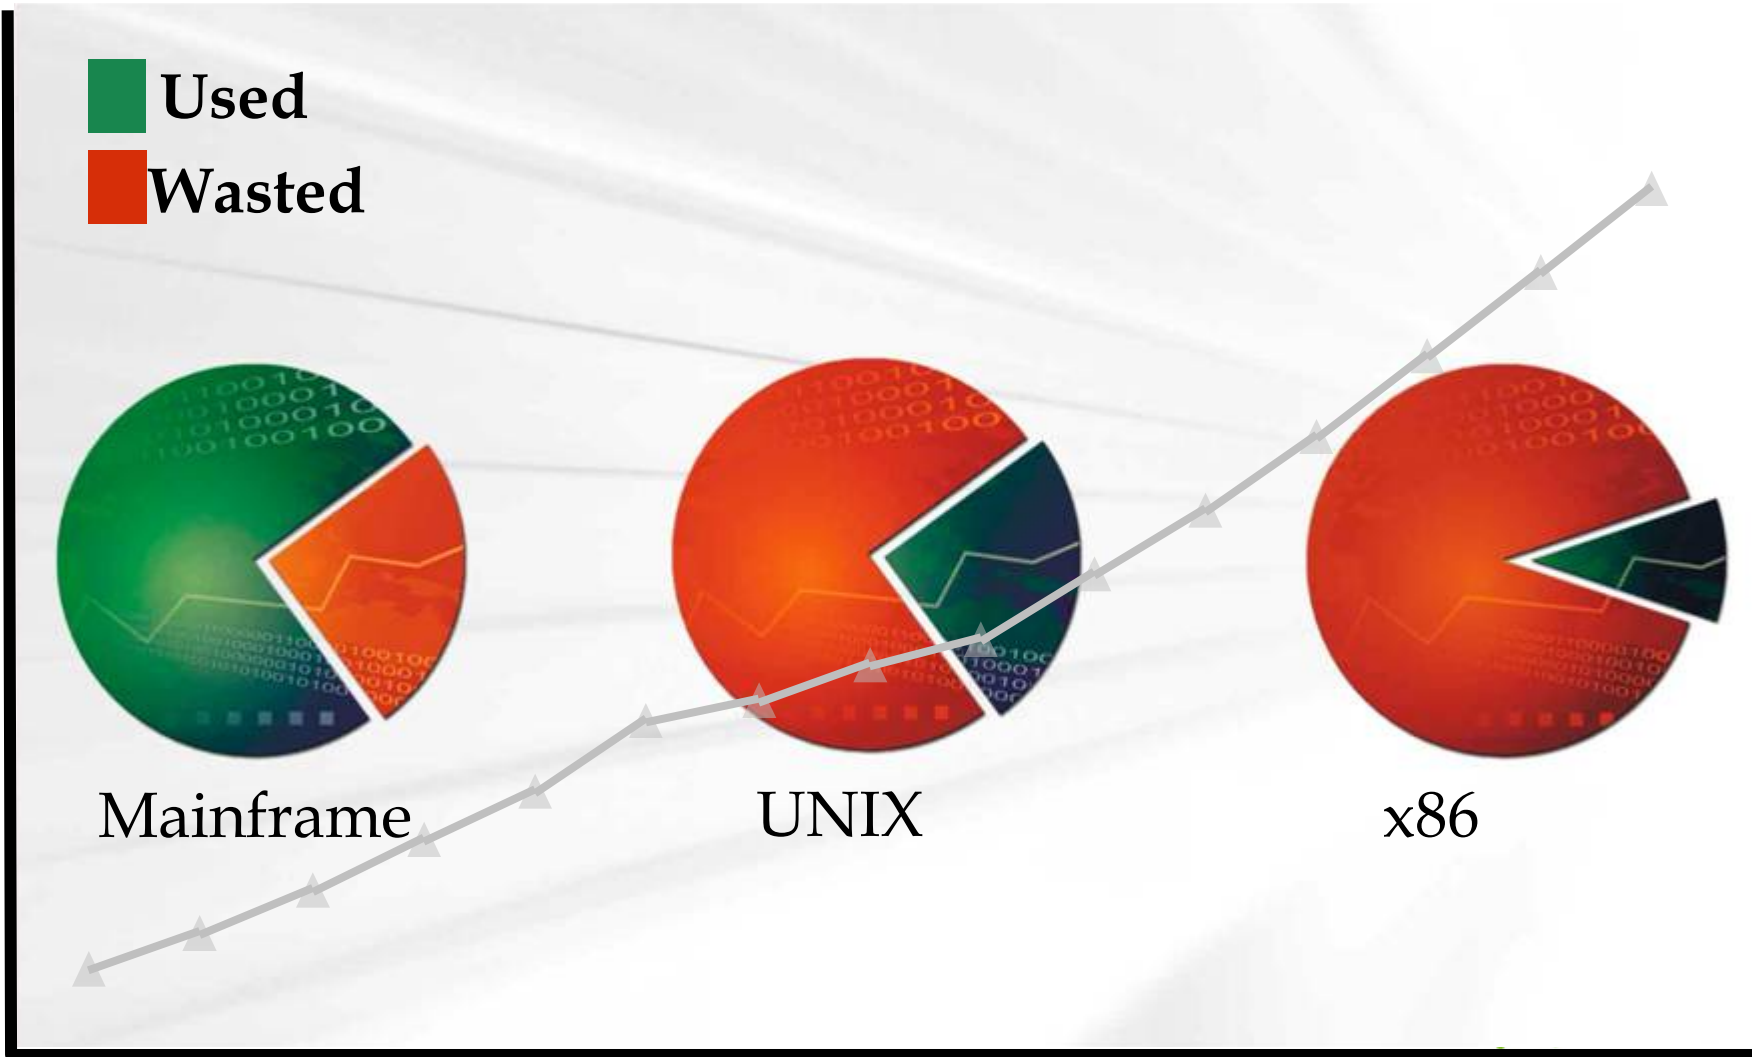

# Myth1: Mainframes are Expensive

- **Acquisition cost** of System z is higher
- Total cost of ownership of mainframes are **lower**
  - End user operations
  - Cost of availability
  - Cost of security
  - Productivity
- Compare **apples to apples**
  - Hidden data center fees tied to the mainframe
- Current System z customers can increase **power for less**
- As the number of MIPS grows the **cost decreases**
- Support **costs** remain **consistent**

# More Powerful Mainframe – Same Staff

# Comparison of Utilization Rates

# System z – Shared Everything

## z/OS Workload

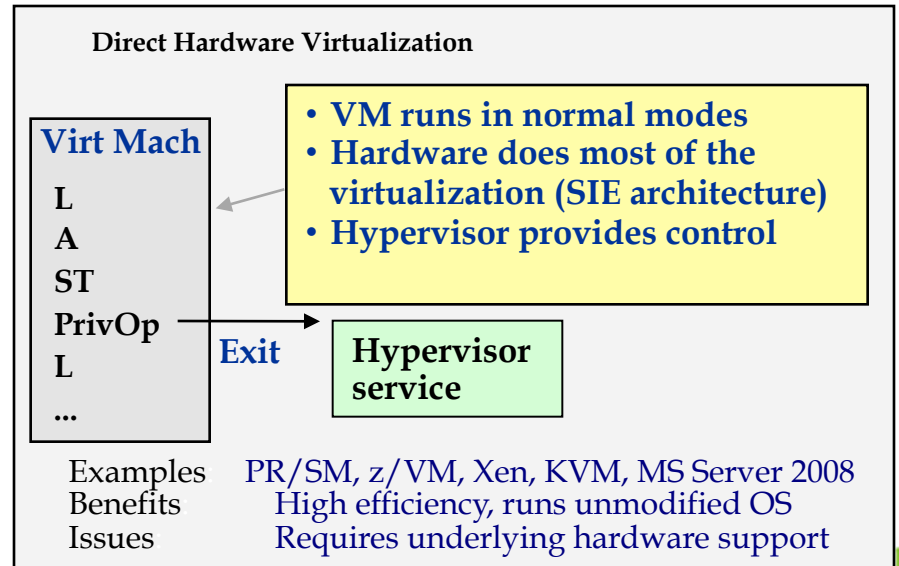

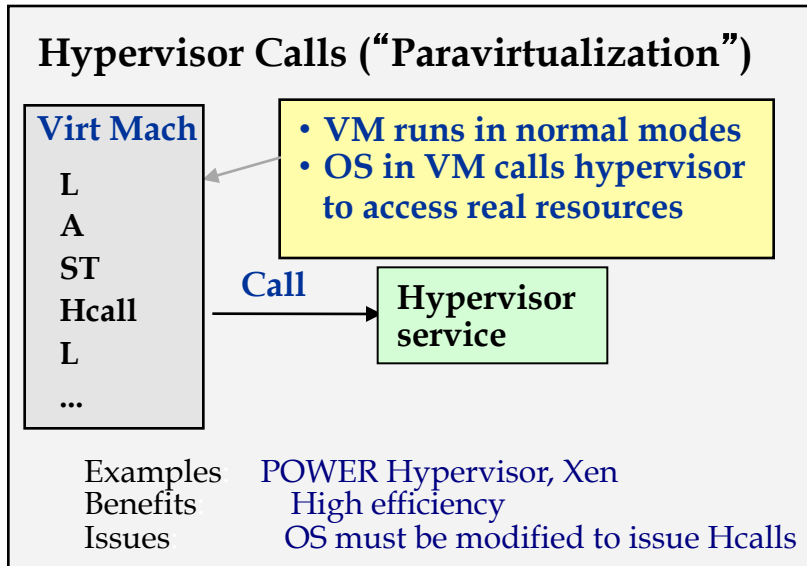

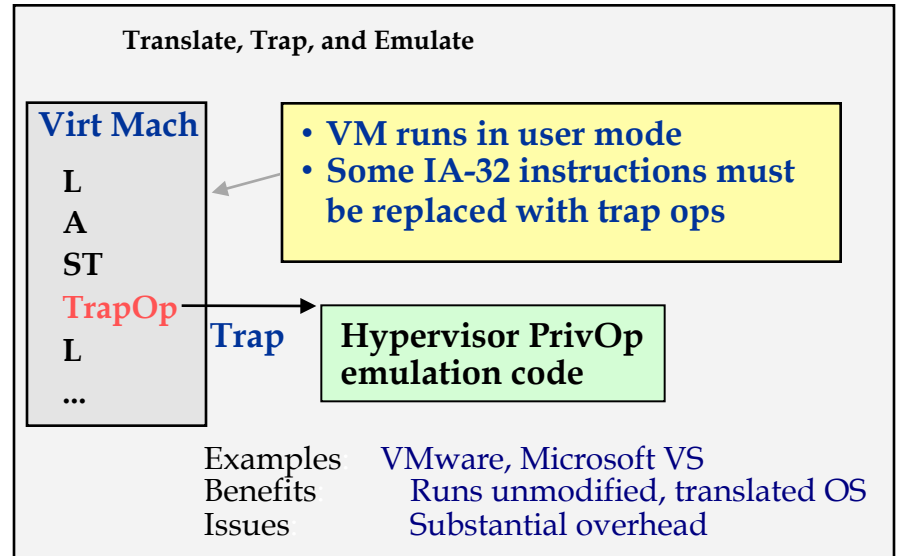

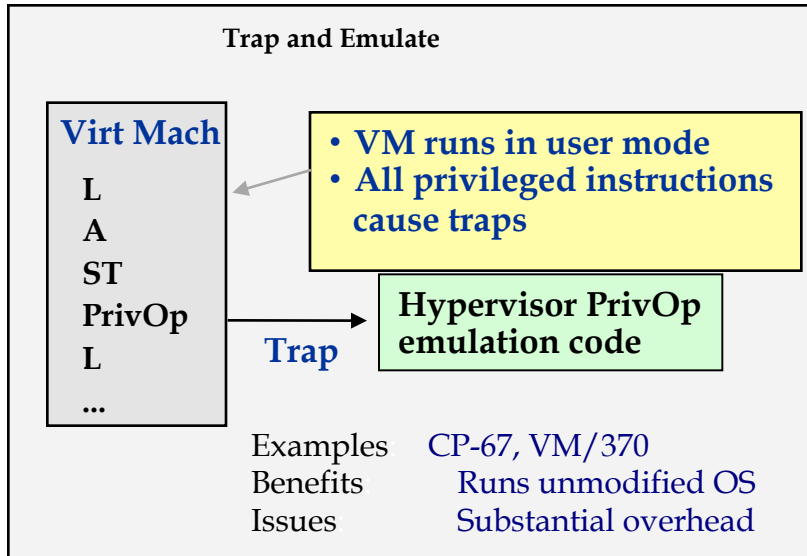

- Varying sizes, arrival rates, and workload types
- **Frequent context switches**
- Need to dispatch work to any available processor with very little affinity to achieve high utilization
- **Significant data sharing between threads**
- I/O operations offloaded to independent channel subsystem

## System z10 Book

- Designed for frequent context switches between short running applications
- **Flattest IBM memory model**
- Shared cache provides faster access and less update delay for shared data
- Strong consistency memory model provides faster updates to shared data (more efficient locking).
- **Breaks CPU affinity quickly**

# Different Virtualization Model

**SHARE**  
Technology • Connections • Results

# Developing a Cost / Value Model

The cost model is where you quantify the items that were developed in the evaluation model

- The choice of cost elements often dictate which platforms are considered the “lowest” cost.
- **Costs in fact go way beyond hardware, software, and maintenance**
- Values are often the inverse of indirect costs
- Develop metrics to quantify value (e.g. outages, security breaches, etc)

## Sample Direct Costs

- Hardware: Prod and non-prod
- Hardware maintenance
- Internal FTEs and consultants
- Software
- Software maintenance
- Power and cooling
- Floor Space
- Network and FC ports
- Residual value
- Disaster recovery
- High Availability
- Asset management

## Sample Indirect Costs

- Cost of an outage
- Security breach
- Cluster complexity
- Business flexibility
- Risk
- Time to market

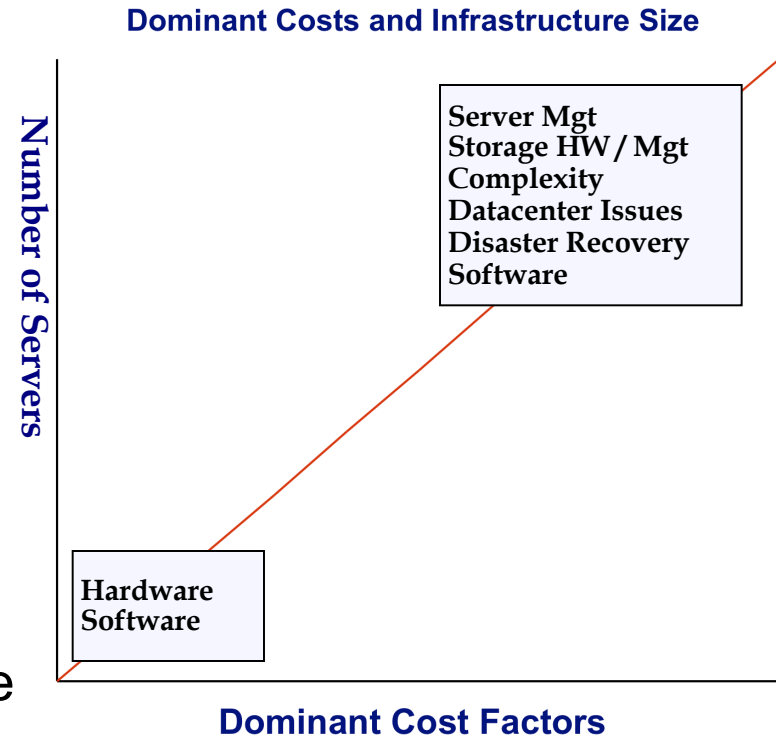

# Cost per Unit of Work

- Centralized Business Infrastructure
  - Initial cost higher
  - Costs decline per transaction
- Dedicated Business Infrastructure
  - Initial costs low
  - Sharing lowers costs per transaction
  - As workload continues to increase so do costs
- A dynamic virtualized infrastructure affects cross over point

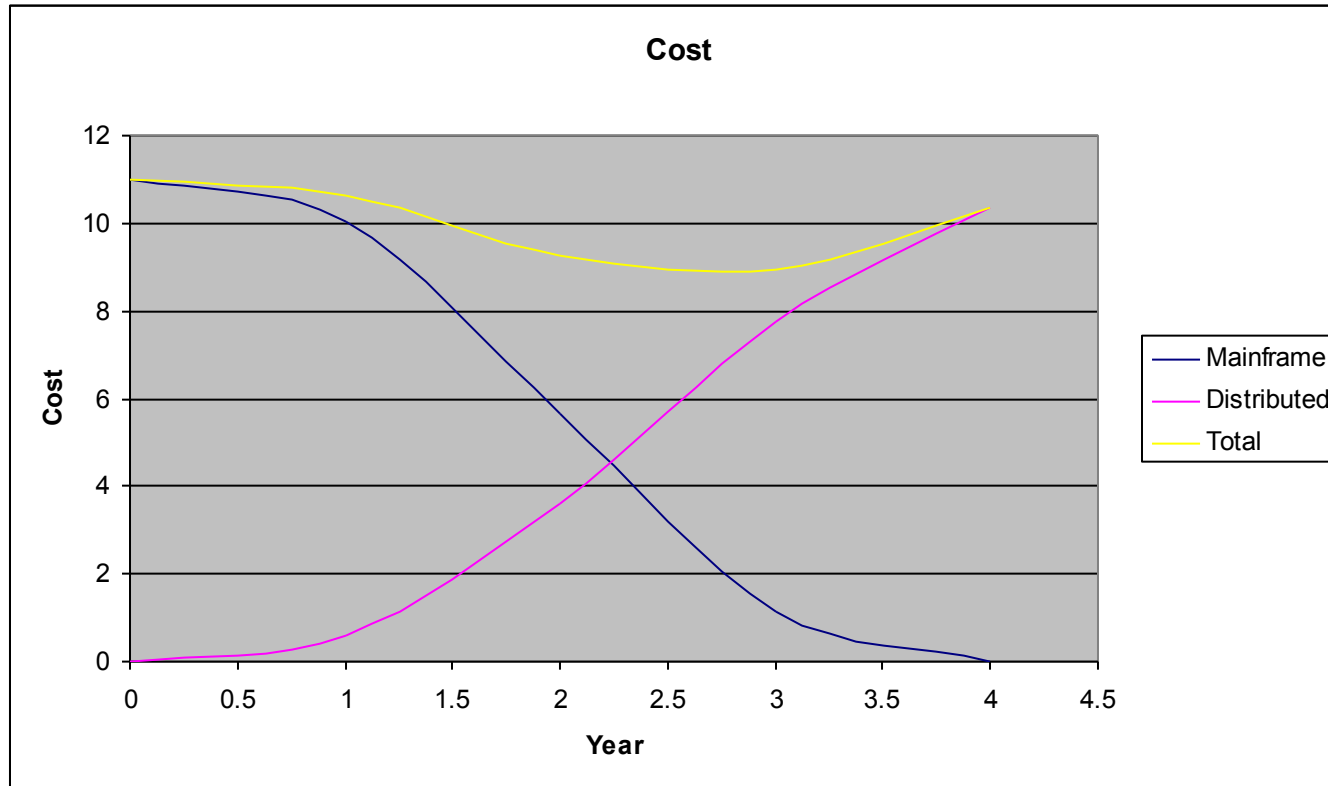

# Dominant Costs Factors Change with Scope

- **Cost Factors**
  - As infrastructure grows, the costs shift from HW/SW to other factors.
- **Deployment Model Matters**
  - Distributed servers offer the lowest cost for small environments.
  - Virtualized servers will most likely dominate the middle of the curve.
  - Centralized servers become critical with scale.
- Line of Business deployment costs may be sub-optimal for the enterprise

# Cost over time

“If technology is saving money, why does the bill go up every year?”

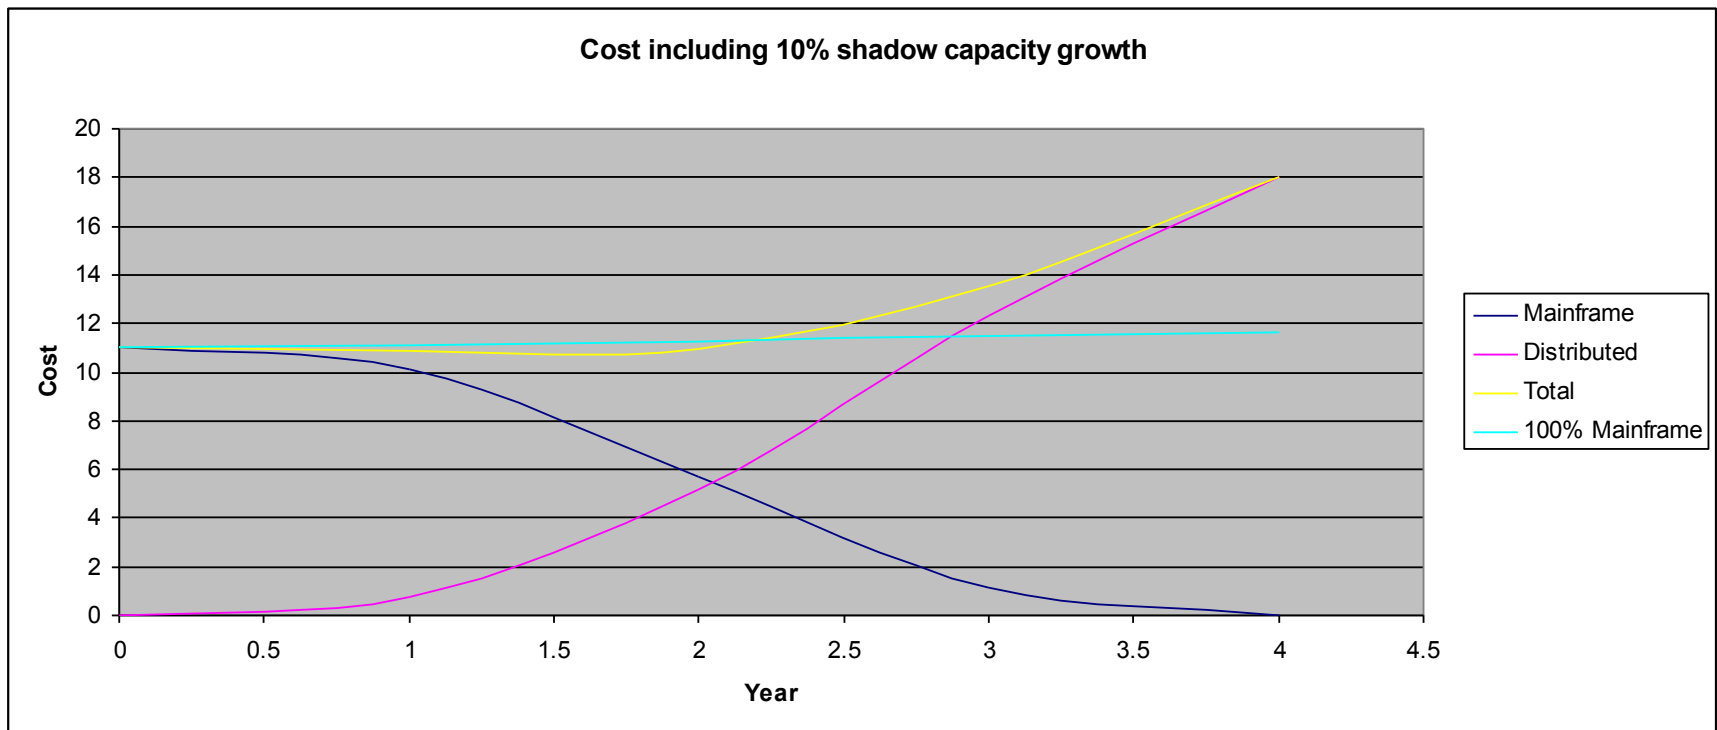

In this case you save money initially but the savings are not sustained  
*This does not include migration costs. The business case is not robust.*

# Shadow Capacity

If you “disintegrate” a z load “shadow capacity” is added to the load.

- Capacity to connect distributed applications to data
- Capacity for Management/Monitoring Software
- Capacity for redundancy
- Capacity due to increases in headroom required to meet SLAs
- Capacity due to lower saturation design points
- Capacity for infrastructure management (Network, Security, Provisioning, etc.)
- Capacity due to shifts in application design and implementation (language changes, code generators, object orientation, etc.)

# Modified cost model

Shadow Capacity eliminates savings

E  
results

# Myth 2: Mainframes are Outdated

- Mainframes support **latest standards**
  - J2EE
  - Linux
  - SOA
  - Open standards
- Mainframes support **collaboration**
  - Simplified integration of infrastructure facilitates collaborative infrastructures
- Rest of the world is **catching up** to zSeries
  - Distributed systems virtualization is behind mainframe
  - Advanced power management
  - Workload management
- Cloud – Making the distributed world more **like the mainframe**
- ITIL – Taking mainframe **procedures** to distributed environments

# Myth 3: Mainframe Skills are OLD!

- Middleware direction is for **platform independent** code
  - J2EE and other containers
  - Cross platform management tools and GUI tools are growing
- Data retrieval protocols favor **platform agnosticism**
  - Cost of mainframe skills flat
  - COBOL programmers do not make more than Java programmers
  - Huge supply of programming skill worldwide
  - Mainframe skill staff are less than 5% higher than distributed skills
- Education of mainframe **skills are rising**
  - IBM's academic initiative has trained 50,000 students
  - Supported by over 600 colleges and universities

**SHARE**  
Technology • Connections • Results

# Myth 4: ISVs Don't Do Mainframes

- Over **6,000** applications from **1,600** vendors on Linux on System z
- J2EE applications run on the mainframe
  - Oracle
  - Temenos
  - SAP
  - Misys
- IBM continues to improve its portfolio for the mainframe to ease ISV **utilization**
- **SOA** and services make mainframe resources more available
- **Web 2.0** Support makes “old” “new”

**SHARE**

Technology • Connections • Results

# Myth 5: Mainframes are Inflexible

- Mainframes **pioneered** Capacity Upgrade on Demand
- Can you say **LPAR**?
- Intelligent Resource Director
- **Transaction based** workload management
- **Virtualization** the other guys wish they had
- **Upgrades** without interruption
- Using zLinux & zOS **collocates** applications and data
- **More** compute power **same** staff

**SHARE**  
Technology • Connections • Results

# Myth 6: Mainframes are slow

- Measurements based on **benchmarks**
- Benchmarks test operations on cached data
- Not based on **real** workload
- Real workload is **messy**
- Not about chip **speeds**
- It's not about calculations

All computers wait at  
the same speed!

# Not All Computers are Created Equally

Sharing the Computer

Shared Everything  
**Low Latency**  
(OLTP, Mixed Workload)

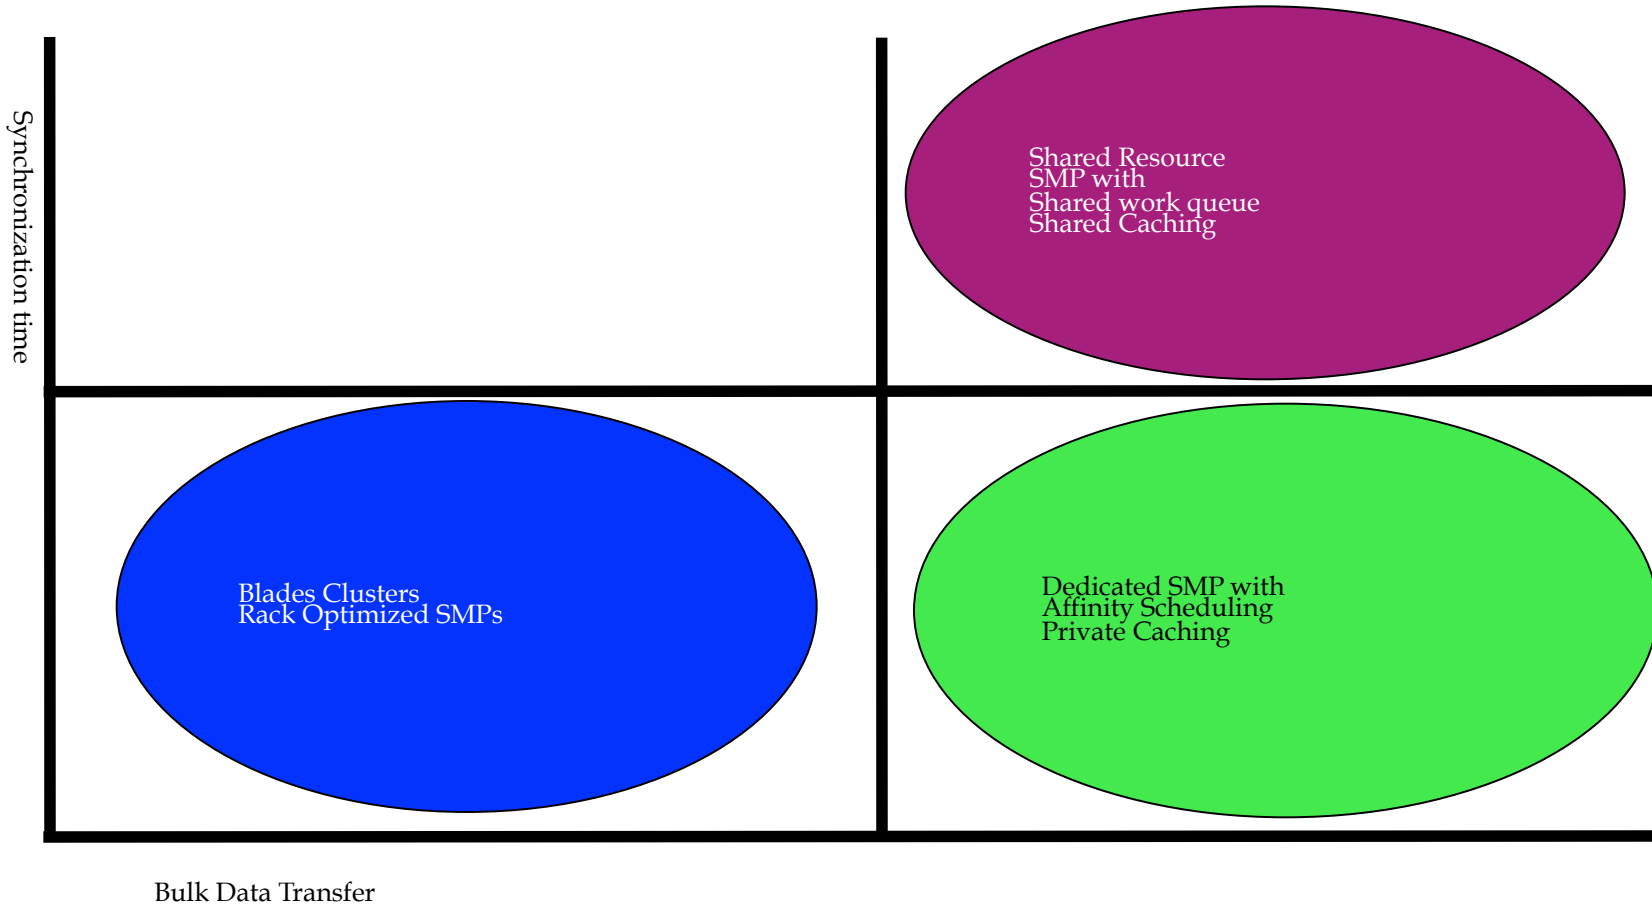

Shared Memory  
**Low - Medium Latency**  
(OLTP, Legacy SMP)

Shared Nothing  
**High Latency**  
(Read Only Web Serving, Some DSS)

Shared Memory  
**High - Medium Latency**  
(Data Warehouse, Some DSS)

Bulk Data Transfer

# Computers and Their Strengths

# Beware of Distributed Platform Bigots

- **Evangelists** understand why theirs is cool
- Just because you **can** doesn't mean you **should**
  - “Just give me enough machines!”
- Beware of distributed use of mainframe terms
- Think about **capabilities** as well as function
  - Non Functionals
    - Security
    - Availability
    - Performance
- Understand the **workload**

# Which is the Better Vehicle?

Maserati MC12

VS

Peterbilt Semi

## The Race - 1/4 Mile Dragstrip

# Which is the Better Vehicle?

100 Maserati MC12s

VS

Peterbuilt Semi

The Race -  $\frac{1}{4}$  Mile Dragstrip  
Carrying 10 tons of crates

# Is this better ?

**VS**  
**?**

10 - Ford F-450 1 Ton Pickups

1- Peterbuilt Semi

## The Race - ¼ Mile Dragstrip Carrying 10 tons of crates

# More than analyzing the speed....

- Can the load be **split** into parts?
  - Can you make more trips with fewer pickups?
- **Where** is the load going?
  - Can the truck go there ?
- 10 drivers vs. 1 driver (**skills**)
- Fuel **cost** differences
- **Maintenance** differences
- Loading/Offloading differences
- Parking differences

**SHARE**  
Technology • Connections • Results

# Myth 7: Small Servers are Cheap

Worldwide IT Spending on Servers, Power, Cooling and Management Administration

Source: IDC

# IT Cost Trends – Alternative view

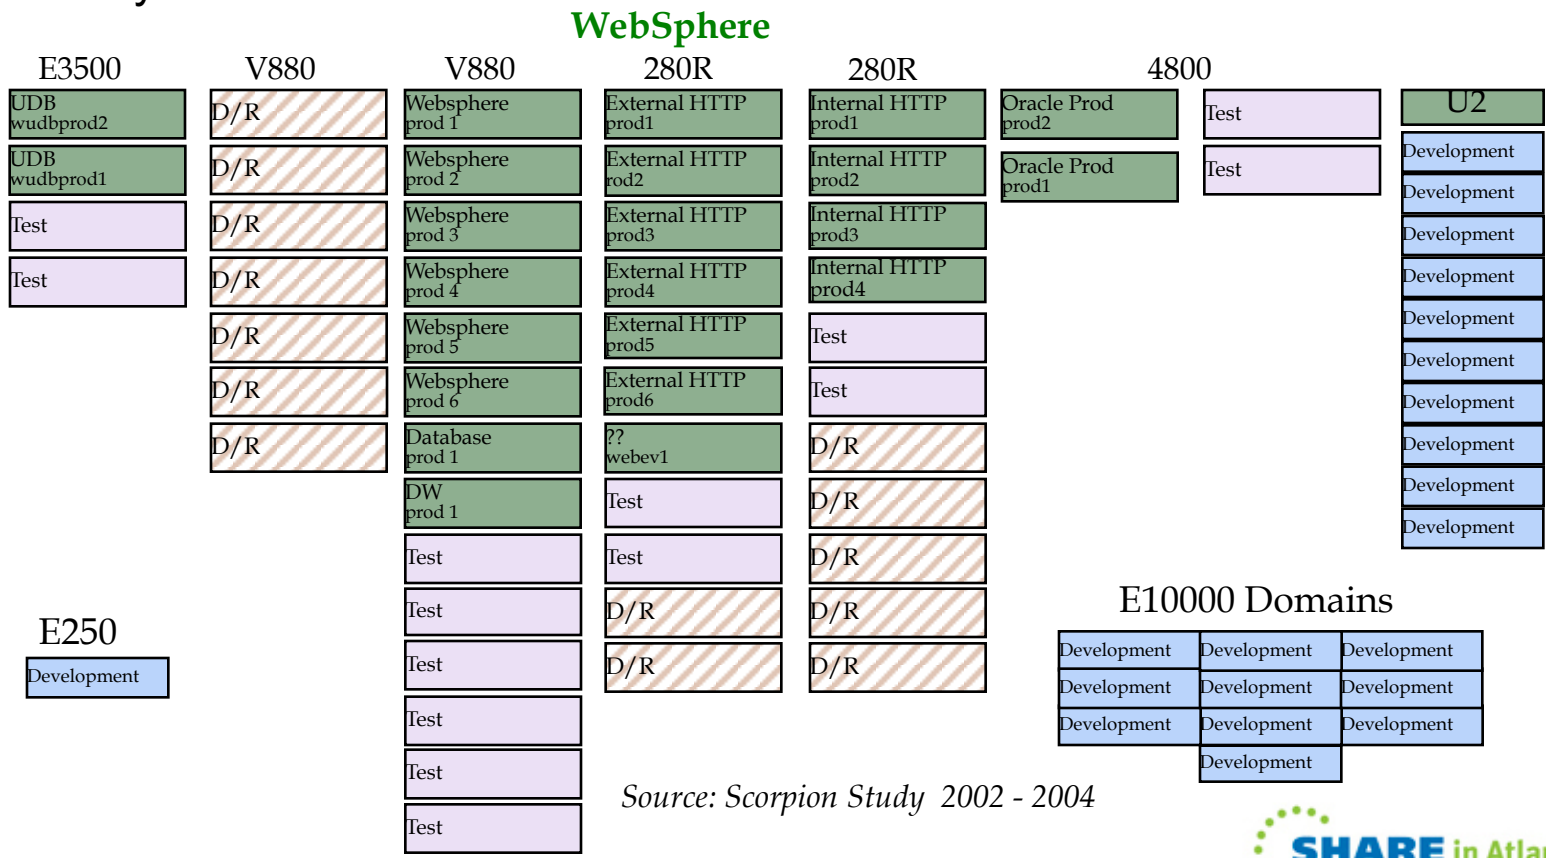

- Management costs are **growing** rapidly
- Software costs grow **linearly**
- Energy costs are **rising**
- Hardware spend is **flat**

**New datacenters  
are expensive!!**

# Case Study: A Sun Loving Finance Co.

- US Finance customer thought they only had 24 UNIX servers
  - But these were just the PRODUCTION servers
  - In addition they had 49 servers for Development, Test and Disaster Recovery

Source: Scorpion Study 2002 - 2004

# The Hidden Costs Kill

- Servers: Distributed **63** vs mainframe **20**
- Admins: Distributed **14** vs mainframe **5**
- Software: Distributed **\$7M** vs mainframe **\$6M**
- The **client thought** Sun was 1/5 the Cost
- With IFLs System z was 37% **cheaper**

**SHARE**  
Technology • Connections • Results

# Myth 7: Cloud Computing Replaces Mainframes

- **Stateless** model
  - Availability based on **replication**
  - **Commit Scope?**
- Relies on **software** only
- Security is an issue
  - Data **Privacy**
- Value for variable workload
- Compliance

**SHARE**  
Technology • Connections • Results

**SHARE**  
Technology • Connections • Results

# Myth 8: Mainframe is too Complex

- Complex **business** problems
- Intricate **process**
- Distributed **complexity** abounds
  - **Hidden** in the data center
- **Green** screen

# Summary

- Too much **disinformation** on mainframe
  - The conspiracy is widespread
- Think **Holistically**
- All you need are the real **facts**
- Create a **level** playing field
- Make sure that you look at the **full picture**
- Understand the **workload**
- Remember the **cost mode**
- Don't be **fooled** by terms

**Please Make those Distributed Weenies Stop!!**

# Trademarks

The following are trademarks of the International Business Machines Corporation in the United States, other countries, or both.

Not all common law marks used by IBM are listed on this page. Failure of a mark to appear does not mean that IBM does not use the mark nor does it mean that the product is not actively marketed or is not significant within its relevant market.

Those trademarks followed by ® are registered trademarks of IBM in the United States; all others are trademarks or common law marks of IBM in the United States.

For a complete list of IBM Trademarks, see [www.ibm.com/legal/copytrade.shtml](http://www.ibm.com/legal/copytrade.shtml):

\* AS/400®, e business(logo)®, DBE, ESCO, eServer, FICON, IBM®, IBM (logo)®, iSeries®, MVS, OS/390®, pSeries®, RS/6000®, S/30, VM/ESA®, VSE/ESA, WebSphere®, xSeries®, z/OS®, zSeries®, z/VM®, System i, System i5, System p, System p5, System x, System z, System z9®, BladeCenter®

The following are trademarks or registered trademarks of other companies.

Adobe, the Adobe logo, PostScript, and the PostScript logo are either registered trademarks or trademarks of Adobe Systems Incorporated in the United States, and/or other countries. Cell Broadband Engine is a trademark of Sony Computer Entertainment, Inc. in the United States, other countries, or both and is used under license therefrom.

Java and all Java-based trademarks are trademarks of Sun Microsystems, Inc. in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

Intel, Intel logo, Intel Inside, Intel Inside logo, Intel Centrino, Intel Centrino logo, Celeron, Intel Xeon, Intel SpeedStep, Itanium, and Pentium are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

ITIL is a registered trademark, and a registered community trademark of the Office of Government Commerce, and is registered in the U.S. Patent and Trademark Office.

IT Infrastructure Library is a registered trademark of the Central Computer and Telecommunications Agency, which is now part of the Office of Government Commerce.

\* All other products may be trademarks or registered trademarks of their respective companies.

## Notes:

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

IBM hardware products are manufactured from new parts, or new and serviceable used parts. Regardless, our warranty terms apply.

All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.

This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.

All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.
