

#SHAREorg

Migrating to and Managing the EMC DLm with DTS Software DLm Control Center (DCC)

Session 11020

Steve Pryor

steve@dtssoftware.com

Agenda

- Issues in a DLm Environment
- DCC Interfaces to the DLm
 - TSO/ISPF, Console/Batch, GUI/Remote
 - Running backend scripts and reports
- DLm Log Monitoring
- Thresholds, Triggers, and Actions

Issues in a DLm Environment

- Tape drive allocation
- Volume Management
- Back-end Utilization and Reporting
- Event Monitoring
- Device Conversion

Tape Device Selection

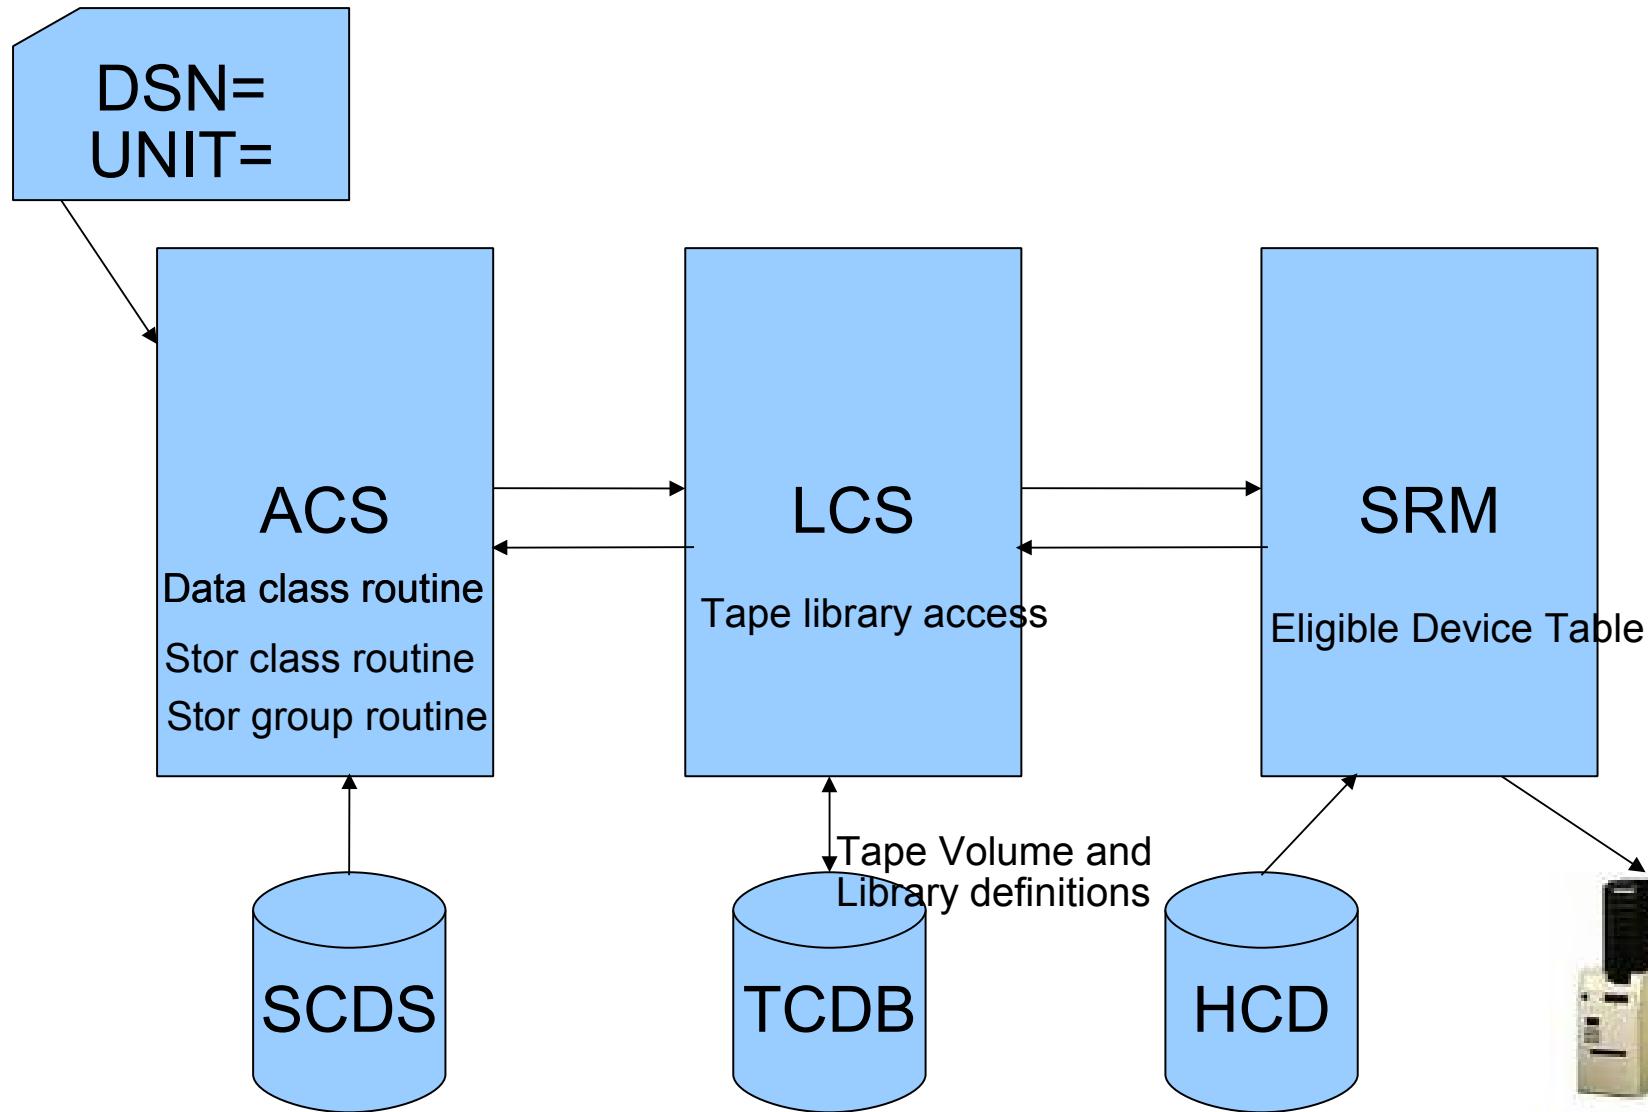

- // UNIT=
 - Specifies a particular group of devices
 - Might contain both DLm and non-DLm
 - Leads to MOUNT errors
 - Can be used to direct allocation to DLm
 - If UIM installed or special esoteric used
 - Requires JCL changes and application changes
- Eligible Device List (EDL)
 - Built at allocation time
 - JCL parameters or catalog info
 - SMS class names, constructs, catalog unit type
 - UNIT, VOLSER, volcount, unitcount
 - Allocation selects desired device

SMS Managed Tape Requirements

- OAM active
- Devices defined as DLm in HCD
- ACS routines
 - STORCLAS
 - STORGRP
- Define
 - SMS constructs (tape SGs and Libs)
 - TCDB (Libraries and Volcats)
- Who's in charge?

Tape Device Selection with SMS

JCL

DLm Management with DCC

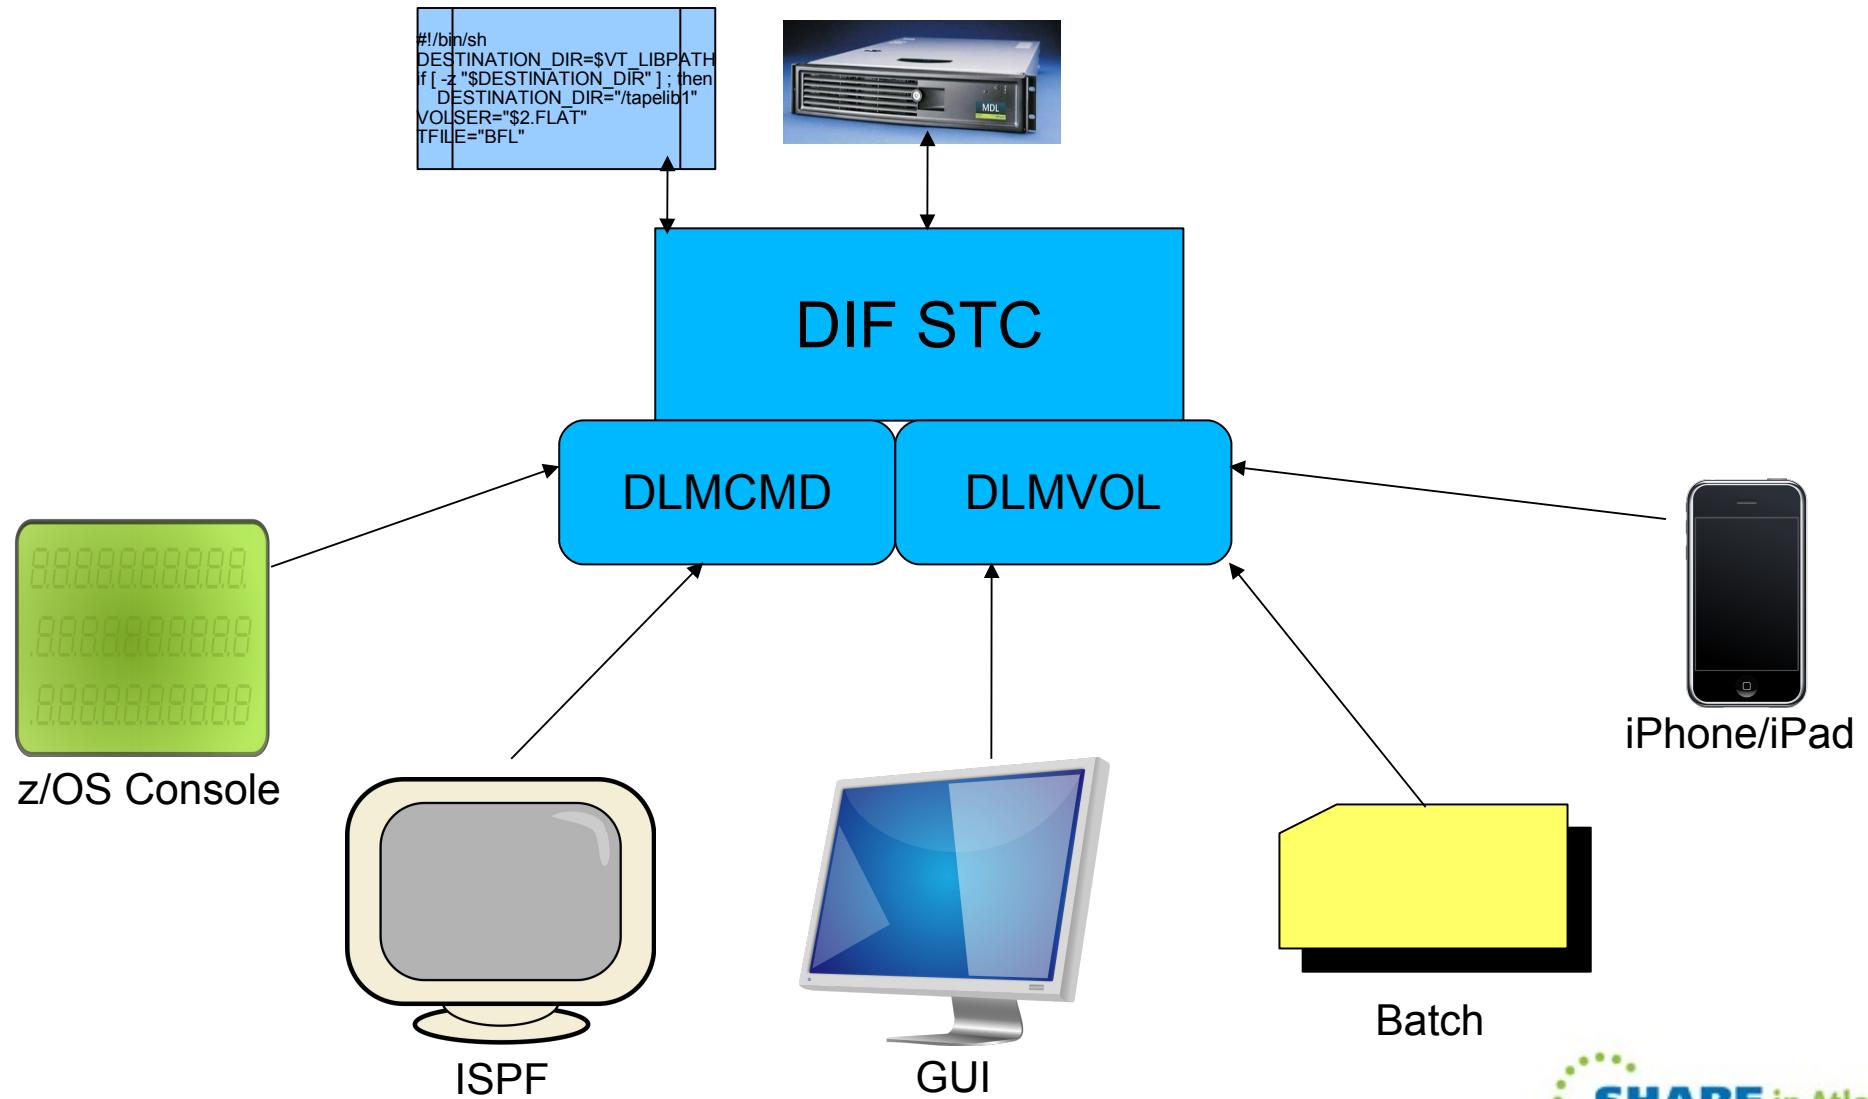

What Can I Do?

- View DLm Configuration
- Issue DLm Commands
- Obtaining DLm information
- Event and Log Monitoring
- Tape Volume Copying (Cloning)

DLm Management

- Allocation Steering
 - via the DCC Policy Rules
 - Define tape libraries in DLMPOLLS member
 - Define allocation rules in DLMRULES member
 - Assign 'scratch synonym' name
 - Assign tape pool
 - Enable DLMLIB= parameter in JCL
 - Break invalid UNIT affinity
 - and more

DCC Management Interfaces

Managing the DLM via DCC ISPF Interface

- View the DLm Configuration
 - Obtain library, device, and volume information
- Issue DLm, z/OS, DIF commands
 - mount/unmount, view, query
 - Issue Linux commands, run EMCxxx scripts
- Activity Logs
 - DLMCLONE audit
 - TCDB and RMM reports

Managing the DLM via DCC ISPF Interface

- Communicates with DIF
 - Via DLMCMD and DLMVOL
 - Via DLm scripts
- Library and Device Status and Commands
 - Select *Node, Library, or Device*
 - READY, REWIND, UNLOAD, QUIESCE ,etc.
 - Device info, drive list, path, mounted vol, etc.
 - Volume information
 - Scratch status, SMS status, etc.

DCC Scratch Exits

- DLMSCR Component
 - Automatically updates tape status in DLm
 - Uses CBRXLCS exits (RMM and MTL)
 - For CA-1
 - Uses TMSUX2S (security) exit
 - Use CA1 ATLTYPE=EMCDLM and ROBSCR option

Managing the DLm via DCC Other Interfaces

Batch

- // EXEC PGM=DLMCMD
- // EXEC PGM=DLMVOL
- // EXEC PGM=DLMUTIL

TSO

- DLMCMD cmdtext
- DLMVOL volser

DIF STC

- F DIF,DLM CMD cmdtext
- F DIF,DLM VOL volser

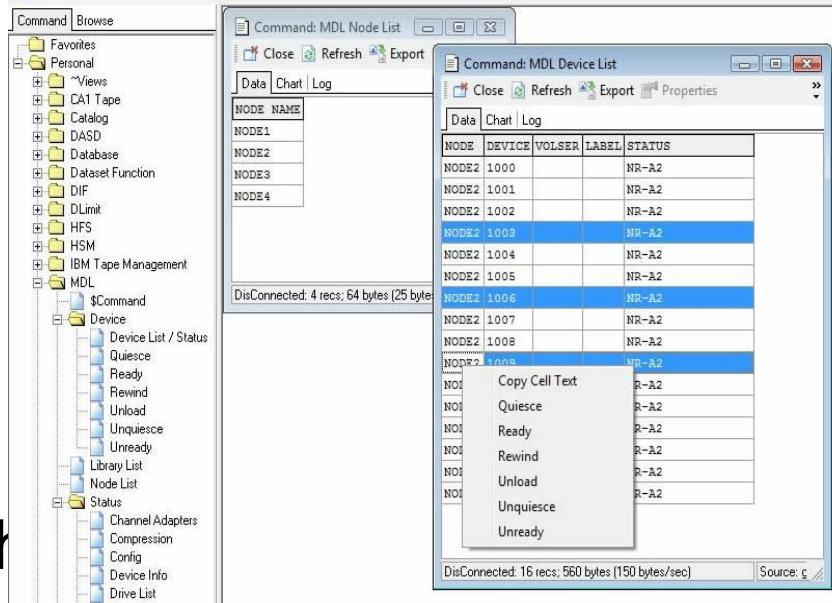

DLMUTIL Control Statements

- Node Commands
- **CMD** – any DLm command
- **MSG** – write to DLm console log file

- Volume Commands (filterable by DATE and DSN)
- **SCRATCH/UNSCRATCH** – change scratch status
- **ERASE** – remove all but labels
- **DELETE** – remove erased scratch tape from DLm
- **OBLITERATE** – SCRATCH+ERASE+DELETE

Managing the DLm via DCC Graphical Interfaces

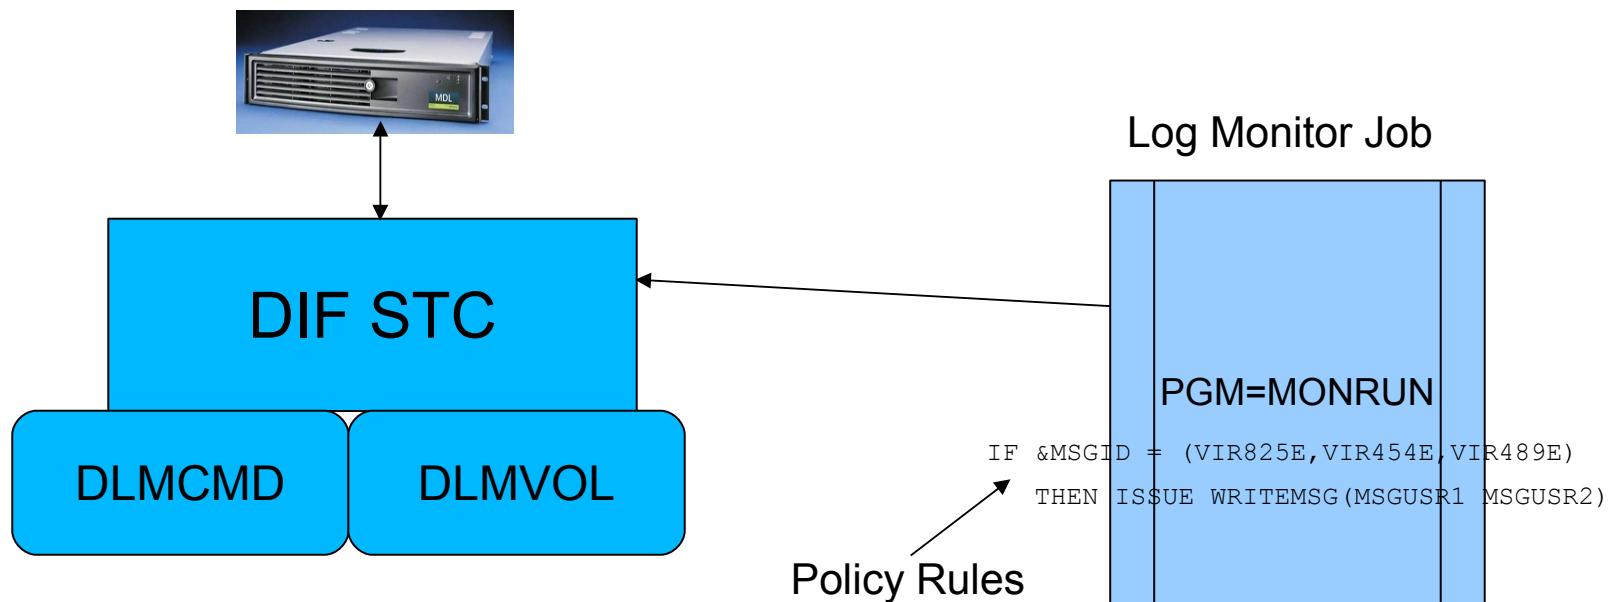

- MONitor/Explorer GUI Application

- Apple iPhone

Managing the DLM via DCC

Monitoring the DLm Activity Log

DCC Log and Event Monitoring

- DCC policy rules to:
 - Identify 'trigger' events
 - Take actions on specified events
 - Email, WTO(R), REXX exec, console command, et. al.
- Policy rules executed via
 - SNMP client under DIF, in real time
 - Batch DLMCMD vs. logs

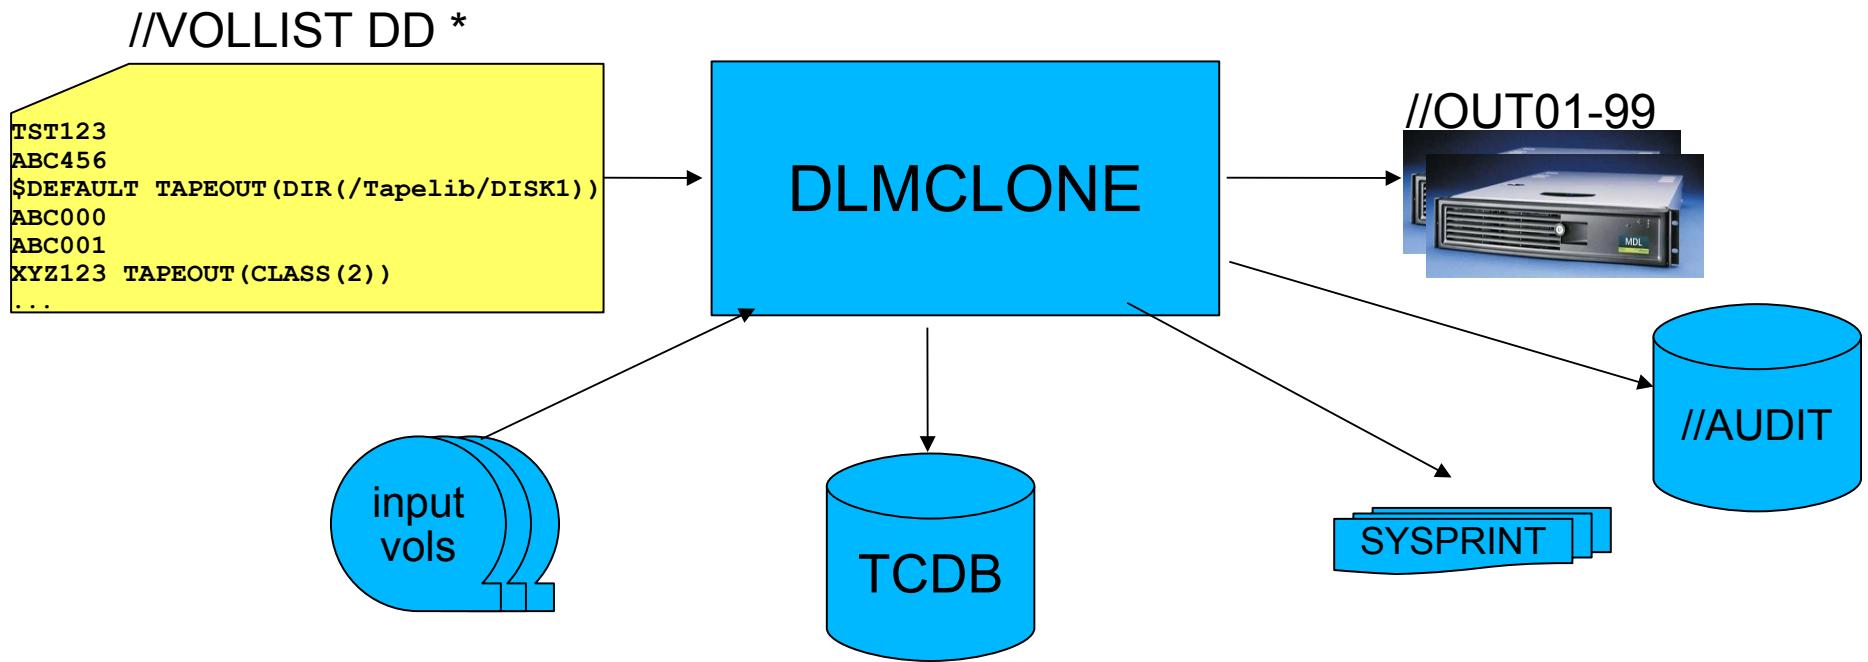

Migrate by Volser or Dataset?

- By volser
 - Simple list of input volumes
 - Less complex auditing
 - Metadata requires updating if volser changes
- By Dataset
 - List of datasets and associated volumes
 - More complex, possibly many mounts
 - Catalog and TMS entries updated with new volsers
 - Move in reverse order of expdt

Migrating to the DLm

- DLMCLONE Utility
 - “clones” tapes
 - Same VOLSER, same LABEL, same UNIT type
 - Updates the TCDB if necessary
 - *NO updates to TMS required!*
 - Restartable
 - Supply a list of volumes for DLMCLONE to copy

Migrating to the DLm

```

//COPYSSTEP EXEC PGM=DLMCLONE,PARM='TAPEIN(UNIT(3490))'
//STEPLIB DD DSN=DT5.R51.LOADLIB,DISP=SHR
//SYSPRINT DD SYSOUT=*
//AUDIT    DD DSN=DLM.CLONE.AUDIT.LOG,DISP=SHR
//OUT1 DD DISP=OLD,UNIT=(3490,,DEFER),DLMLIB=TAPELIB1,LABEL=(,BLP),VOL=SER=DUMMY1
//OUT2 DD DISP=OLD,UNIT=(3490,,DEFER),DLMLIB=TAPELIB1,LABEL=(,BLP),VOL=SER=DUMMY2
//OUT3 DD DISP=OLD,UNIT=(3490,,DEFER),DLMLIB=TAPELIB1,LABEL=(,BLP),VOL=SER=DUMMY3
//VOLLIST DD *
ABC101
ABC102
ABC103
ABC104

```

Annotations in the code:

- Input unit:** Points to the UNIT(3490) parameter in the //COPYSSTEP EXEC statement.
- input volser:** Points to the ABC101 through ABC104 entries at the bottom of the code.

DLMCLONE Options/Control Stmt

- OPTION Parm
 - NL – copy NL tapes (using Linux scripts)
 - NOEOV – bypass check for EOF2 label
 - NORECOV – bypass ERP processing (set DCBIFIOE)
 - NOTCDB – do not update OAM TCDB
 - NOVERIFY – bypass checksum validation
 - TM(n) – define end-of-tape indicator
- STOP Command
- Stops all subtasks at end of current volume

DLMCLONE Options/ControlStmts

- TAPEINParms
 - COUNT(n) – no. of volumes to copy
 - LIST(ddname) – alternate ddname for VOLLIST
 - UNIT – input unit name
- TAPEOUTParms (optional)
 - CLASS(n) – output DLm class for volumes
 - DIR(path) – output DLm path
 - - or allow DLMRULES to direct output allocation

DLMCLONE Activity Log

- Audit Trail
 - //AUDIT DD DSN=ksds.audit.file,DISP=SHR
 - Parms
 - AUDIT(DDNAME)
 - AUDIT(FORCE) – recopy already migrated volume
- View the Audit Log via ISPF or batch interface

DLMCLONE Restart Procedures

- Restart Process
 - Read AUDIT file and skip tapes in 'DONE' status
 - Query DLm and skip tapes already in library
- Identifying Incomplete Tapes
 - Cancellation Report – identify tapes in COPY status
 - DLMCLONE Sysprint – identify input tapes
 - Use DLMUTIL to remove partially copied tapes from DLm
 - Use FORCE operand to recopy partially copied tapes

JES3 Support

- DCC supports JES3 for:
 - Allocation Device Selection
 - Load Balancing
 - DLm Commands and Queries
- Sets appropriate UNIT esoteric via:
 - IATUX11 – for catalogued volume requests
 - IATUX06 – for specific volume requests

JES3 Support

- Checklist
 - Reserve devices for DCC command processing
 - Update JES3 init deck
 - Start JES3 with assembled user exits
 - Start DCC with appropriate DCCRULES/POOLS

Questions?
