Abstract

The IBM Unified Resource Manager, or zManager, now provides a set of application programming Interfaces (APIs) to carry out tasks to manage the zEnterprise platform. Using these APIs allows management of the virtual server platforms and the lifecycle of virtual servers running across the zEnterprise to be automated. This session provides an understanding of these APIs, and illustrates an example of their usage via monitoring and discovery functions in IBM Tivoli products.

Agenda

- Unified Resource Manager overview and integrated Service Management positioning
- zManager Web Services API overview and functions
- IBM Tivoli Service Management product API users
 - zEnterprise Monitoring Agent
 - System Automation for z/OS (SA for z/OS)
 - System Automation Application Manager (SA AppMan)
 - Tivoli Application Dependency Discovery Manager (TADDAM)*

Unified Resource Manager (zManager)

- Runs on zEnterprise Hardware Management Console (zHMC)
- Management and control of zEnterprise ensembles (z196 and connected zBX racks)
 - Operational Controls
 - Hypervisor Management
 - Virtual Server Lifecycle Management
 - Network Management
 - Workload Awareness and Platform Performance Management
- Administration, not monitoring, oriented
 - Dynamic information saved for a brief period
 - Restricted access to zHMC
- No integration with management data “within” the virtual servers, other than the Guest Platform Management Provider (GPMP)

zEnterprise and Integrated Service Management

Workload & Service

Visibility. Control. Automation.™

Integrated Service Management

Integrated Service Management compliments zEnterprise workload optimization and extends the visibility, control and automation across not only workloads, but end-to-end business and IT services for maximum business value.

Tivoli Integrated Service Management

Heterogeneous Management

- Align IT management with business goals
- Service availability and performance management
- Service delivery and IT process automation
- Virtualization and ensemble management - server, mainframe, storage
- Security Management & Compliance
- Asset, facilities and energy management
- Network Management

zEnterprise Unified Resource Manager (zManager)

Platform Management for Z, P & X Series

- Workload based resource allocation and provisioning
- Physical and virtual resource management
- Goal oriented resource management
- Ensemble, Network and Storage management
- External management APIs

Hardware Management for Z, P & X Series

- Configuration management for hardware/firmware
- Operational control for hardware/firmware
- Service and support for hardware/firmware
- Lifecycle management for the platforms virtual resources

zManager APIs to Support Integrated Service Management

“IBM intends to offer Application Program Interfaces (APIs) for IBM zEnterprise Unified Resource Manager. These APIs provide access to the same underlying functions that support the Unified Resource Manager user interface”

Hardware Management Console Web Services API became generally available in December 2011

“IBM plans to enhance Tivoli's Integrated Service Management for System z portfolio of products to provide integrated end-to-end **monitoring, alerting, discovery, automation**, storage, and security solutions to take advantage of the zEnterprise ensemble monitoring and management capabilities provided by the API support” (July 2011)

Current Tivoli zEnterprise zManager API Solutions at a Glance

zManager Web Services API

See “IBM System z Hardware Management Console Web Services API Version 2.11.1 (SC27-2616-00) for the details

- Representational state transfer (REST) format via HTTP 1.1
 - Conceptual data model with defined objects
 - URI in HTTP defines operation and target object
`GET /api/virtual-servers/{vs-object-id}/virtual-disks/{disk-id}`
 - Input parameters and returned response are in JavaScript Object Notation (JSON) format
`{"api-major-version":1,"hmc-version":"2.11.1","hmc-name":"TSYSENSA","api-minor-version":1}`
 - Can be synchronous or asynchronous
 - *Asynchronous requests are assigned a “job” ID*
- Includes an JMS based asynchronous notification facility
 - Receive messages for certain predefined management events

API Request Flow (Simplified Example)

JSON notation used for request and response bodies

API Functional Groups

See *“IBM System z Hardware Management Console Web Services API Version 2.11.1 (SC27-2616-00) for the details*

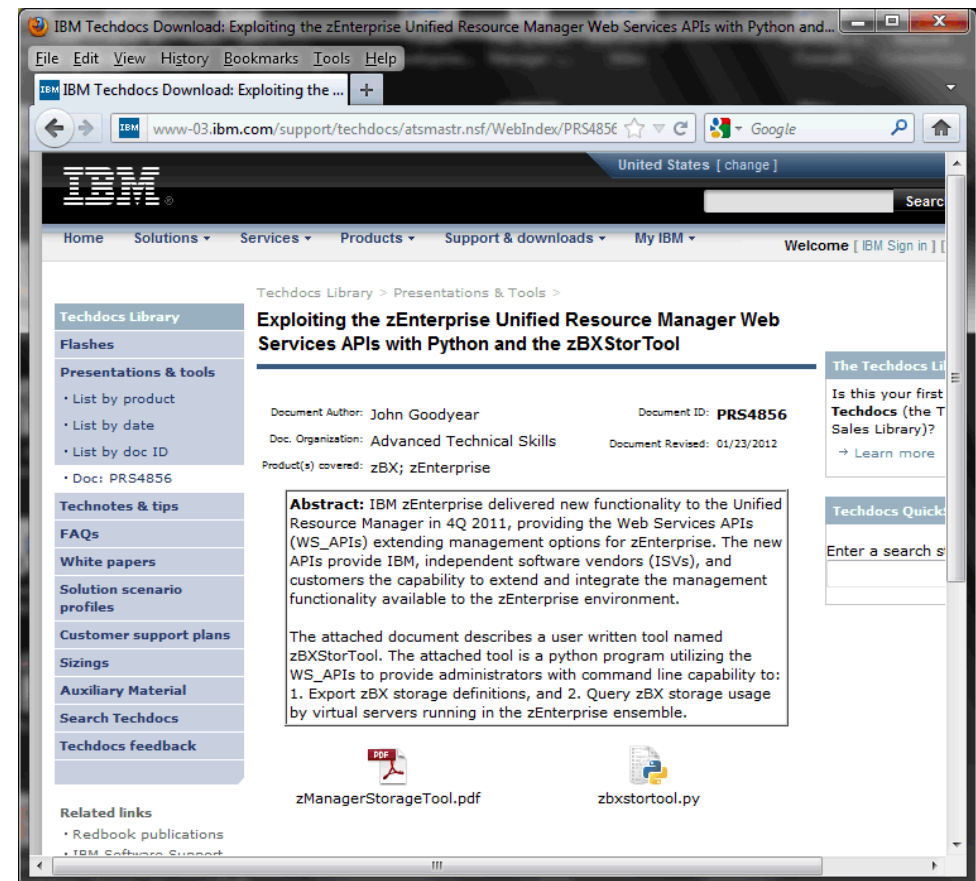

General services	logon, logoff, query version, query/delete job status
Ensemble composition	list, get/update properties, add/get/remove nodes
zBX infrastructure	zBX, Top-of-Rack Switch, Racks, BladeCenters, Blades, IEDN
Energy management	Control CPC, BladeCenter, Blade power characteristics
Virtualization management	Control virtualization hosts properties, manage virtual servers life cycle
Storage management	Create/list/get physical storage resource properties (for supported storage resources) and manage virtualization host storage
Virtual network management	list/get/create/update/delete virtual networks
Workload resource group	Workload resources groups and associated performance policies and virtual servers
Core System z resources	HMC/SE console, groups, CPC, logical partitions, activation profiles, capacity records
Inventory and metrics services	create/delete metrics contexts, retrieve ensemble information and properties

API Custom Usage

- Any programming language that supports TCP/IP socket programming
 - Much easier if it supports higher level constructs (HTTPS, SSL, JSON)
 - Python, Java good choices to start
- Programming Model
 - Set up SSL certificates – varies by language
 - e.g. Java – import HMC SSL certificate into truststore and set properties for access
 - Use API logon command to authenticate
 - A session ID is returned that must be used in subsequent calls
 - Issue desired API commands
 - Use API logoff command to end session
- Sample Python code available on IBM ResourceLink
 - (Services->API->Web Services API Samples)

Usage Example: zBXStorTool

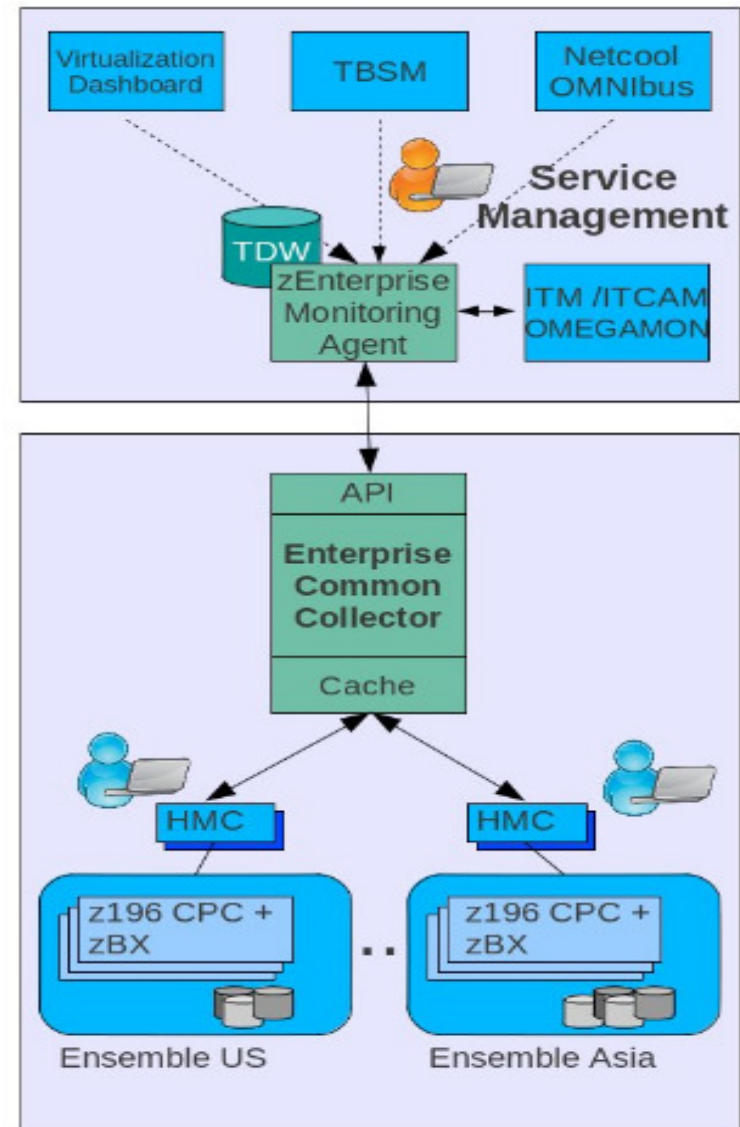

- Developed by John Goodyear of the IBM Washington Systems Center
- Provides functions that simplify storage administration for zEnterprise zBX:
 - Export storage definitions for entire ensemble or filtered by hypervisor
 - Show relationship between virtual servers and the storage resources they use
- Python script and whitepaper with client programming hints and tips
- Provides a more comprehensive example of WS API usage

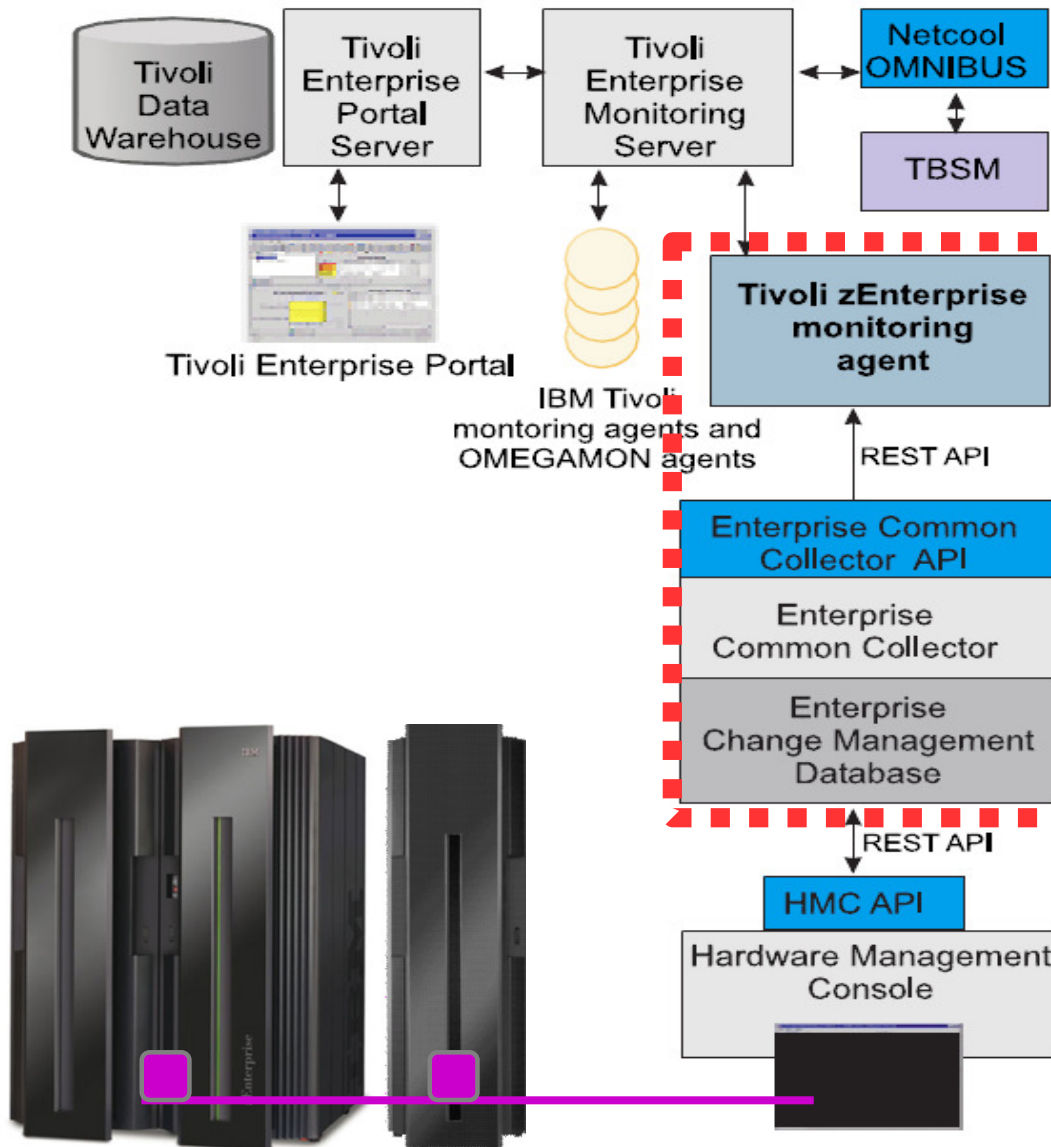

API Usage by the IBM Tivoli zEnterprise Monitoring Agent

zEnterprise Monitoring Agent

- Provides visibility into the IBM zEnterprise hybrid infrastructure, including hardware resources, hypervisors, virtual servers, and workload resource groups
- Automated discovery of resources within the monitoring environment
- Integrates the information into IBM Tivoli Monitoring infrastructure to provide:
 - information highlighting and alerting capabilities
 - integration with information provided by other agents in the ITM infrastructure
 - Optional long term history collection and reporting/trending with the Tivoli Data Warehouse and Tivoli Common Reporting
 - Optional event integration and Business Service Management with Netcool/OMNIBus and Tivoli Business Service Manager (TBSM)

Component Architecture

Enterprise Common Collector (ECC)

- Captures data from Unified Resource Manager via the zManager APIs
- Provides a ReST API to other Tivoli products for access its collected data
- Can connect to multiple zHMCs to consolidate monitoring

IBM Tivoli zEnterprise Monitoring Agent

- Displays captured data in the Tivoli Enterprise Portal
- Records data into the Tivoli Data Warehouse for reporting/trending usage
- Situations to TEP and/or EIF events to Netcool/OMNIBus/TBSM, NetView on z/OS, etc.

ECC and zEnterprise agent can be located on the same or separate servers

Requirements

- zEnterprise HMC application version 2.11.1 with firmware maintenance bundle 30 or later
- IBM Tivoli Monitoring 6.23 Fixpack 1
- Supported operating system platform for ECC and zEnterprise monitoring agent
 - Linux (x and z), AIX, Windows 2003/2008
- HMC Configuration
 - REST Web Service APIs must be enabled
 - User ID with appropriate object authorities and API authority must be defined
- Optional
 - Tivoli Common Reporting 2.11 (sample reports are provided)
 - Netcool/OMNibus or NetView for z/OS or any other EIF event receiver (for event integration)

Installation and Configuration

- Both install via GUI or command line (silent install)
 - ECC installation decisions: install directory, IP ports to use
 - zEnterprise Agent installation decision: ECC to connect to
- ECC configuration
 - Start/Stop via command (or service on Windows)
 - Administered through command line shell or API
 - Administration actions
 - ECC client users, authentication method and authority
 - HMC SSL certificates
 - Collection profiles (data collection and inventory resync intervals)
 - Data sources (HMC connection and collection profile)
 - Logging
- zEnterprise agent configuration

Target ECC

Alerting

- ITM Situations provided to raise alerts based on reported information
 - CPC, blade, and workload warning/minor/critical/fatal status changes
 - Virtual server status acceptable/unacceptable
- Custom situations can be defined based on environment
- Situations can be
 - Correlated with other ITM situations in an ITM workflow policy
 - Forwarded to event managers as Event Integration Facility (EIF) events for viewing and/or correlation outside of ITM. Examples:
 - Netcool/OMNibus
 - TBSM (via Netcool/OMNibus) for business service impact
 - NetView on z/OS

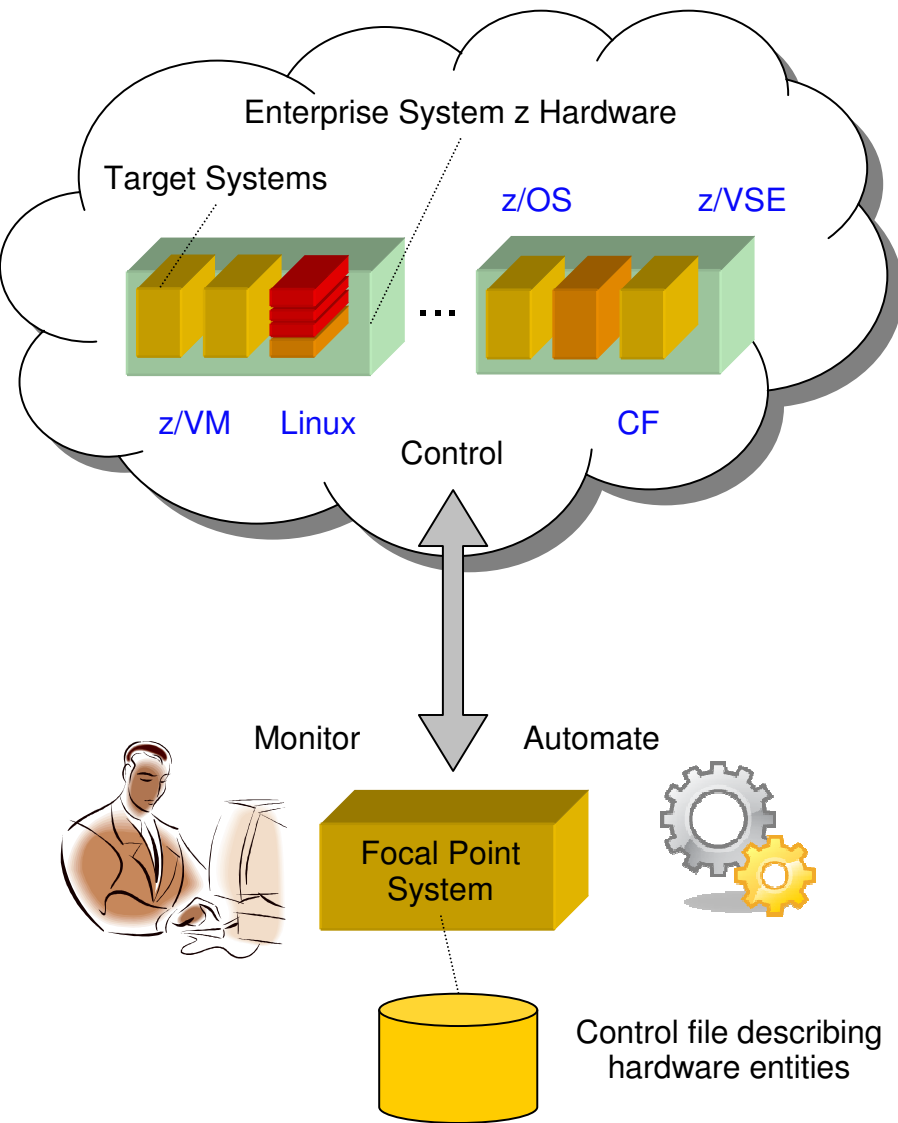

Reporting

- Data can be stored in Tivoli Data Warehouse for long term reporting/trend analysis/forecasting
- Roll your own reports or use reporting packages
- Predefined reports provided for use with IBM Tivoli Common Reporting
 - Performance trends
 - Workload rightsizing and balancing
- Tivoli Common Reporting allows
 - Report customizing
 - Scheduled report generation in various formats (PDF, HTML,...)
 - Scheduled report mailing/notification

API Usage by System Automation for z/OS

Hardware Operations Today at a Glance

- Hardware operations (HMC / SE) and monitoring
 - Enterprise-wide
 - Central focal point concept
- Automation
 - Product provided standard automation
 - Customer extensions
- Policy
 - Common SA z/OS automation policy for hardware and applications
 - Central administration
- SA z/OS provides two hardware interfaces for
 - Central hardware automation and monitoring
 - LPAR management functions
 - Coupling Facility operations
 - Geographically Dispersed Parallel Sysplex (GDPS)
- SA z/OS provides Processor Operations (ProcOps) Service Machine to operate z/VM guests

Basic Availability and DR – SA z/OS V3.4

Enhanced hardware automation capabilities

- SA z/OS Processor Operations is used already today to automate hardware operations in System z environments
- Enhancements:
 - Include new elements in policies
 - Awareness of zBX, blades, virtual server and their workload context
 - Informed about changes
 - Similar commands (as much as possible) for zBX elements as exist for CPC
- Value
 - **Reduced operations costs** due to SPOC for zEnterprise automated HW operations
 - Simplified site management for planned and unplanned outages
 - Immediate alerting based on policy in case of failures
 - Foundation for GDPS Application CA/DR solution

SA z/OS ProcOps / GDPS

SA z/OS Capabilities

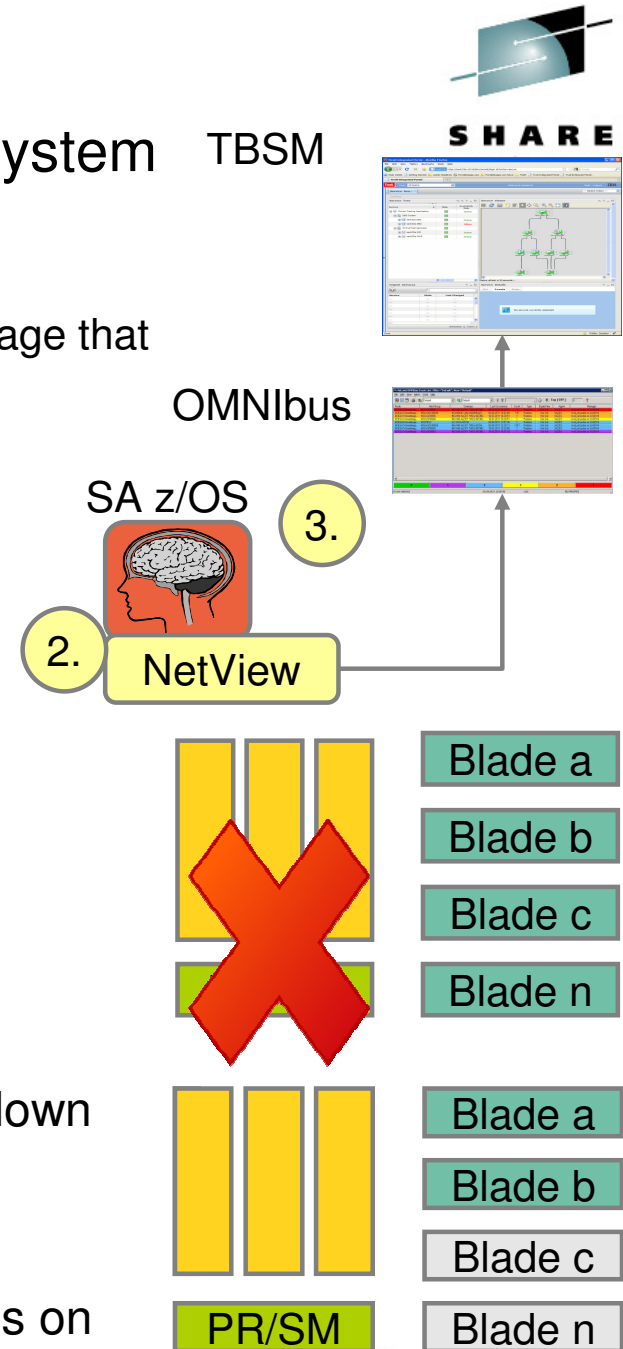

Via SA z/OS ProcOps Commands and Messages

- Monitor connection to configured Ensembles
- Monitor status and properties of CPCs, Blades, and Virtual Servers
- List properties of ensemble resources known to SA z/OS
- List Workload Resource Groups and contained virtual servers
- Activate/deactivate blades and virtual servers
- Monitor inventory, status and property changes for
 - Blades
 - CPCs
 - Virtual servers

Sample Scenarios

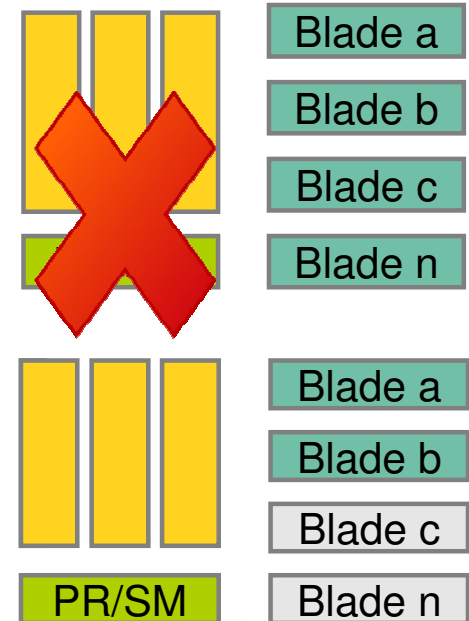

Indicate blade not operating in context of business system TBSM

1. Subscribe for changes at zBX blades
2. Blade fails unexpectedly. ProcOps detects this and creates message that runs through NetView Automation Table
3. Automation Table action INGALERT is used to forward EIF-event to OMNibus from where it can be brought into TBSM
 - ✓ LOB is immediately informed about potential failure

Datacenter power management + Site Failover

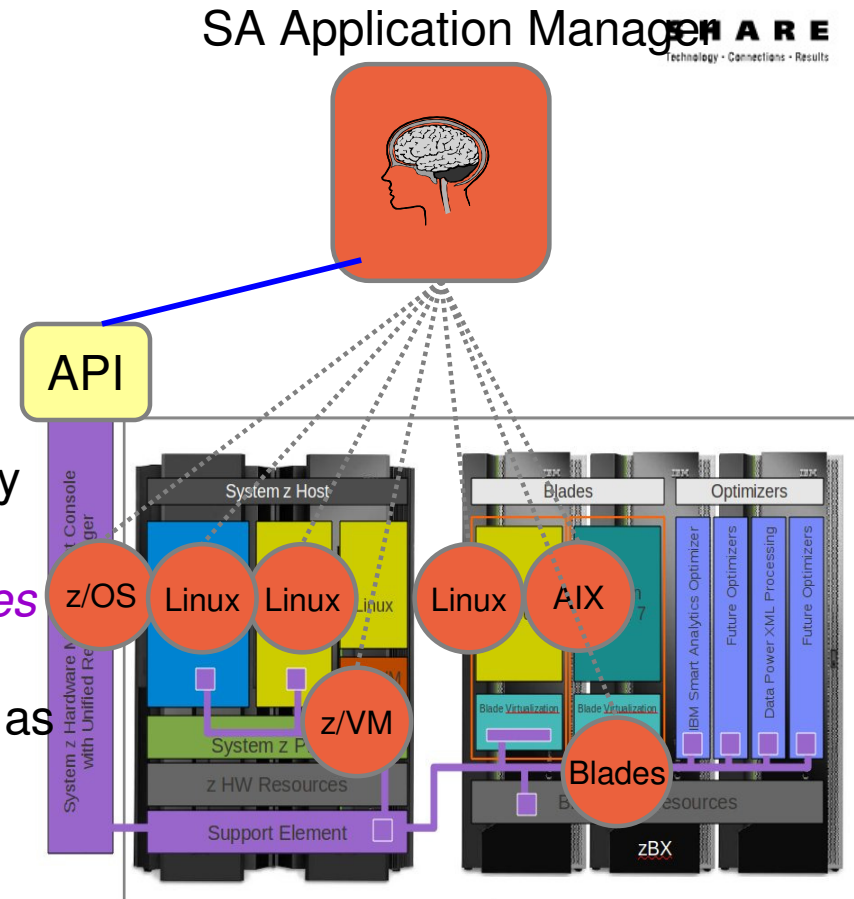

- Shutdown of complete node due to maintenance
 - Use SA z/OS ProcOps to
 - deactivate all blades
 - deactivate all LPARs
 - power off CPC and zBX
 - ✓ Fully automated hardware operations enables quick shutdown and startup and reduces overall maintenance window
- Site takeover directed by GDPS
 - GDPS, through SA z/OS ProcOps, activates idle resources on backup server

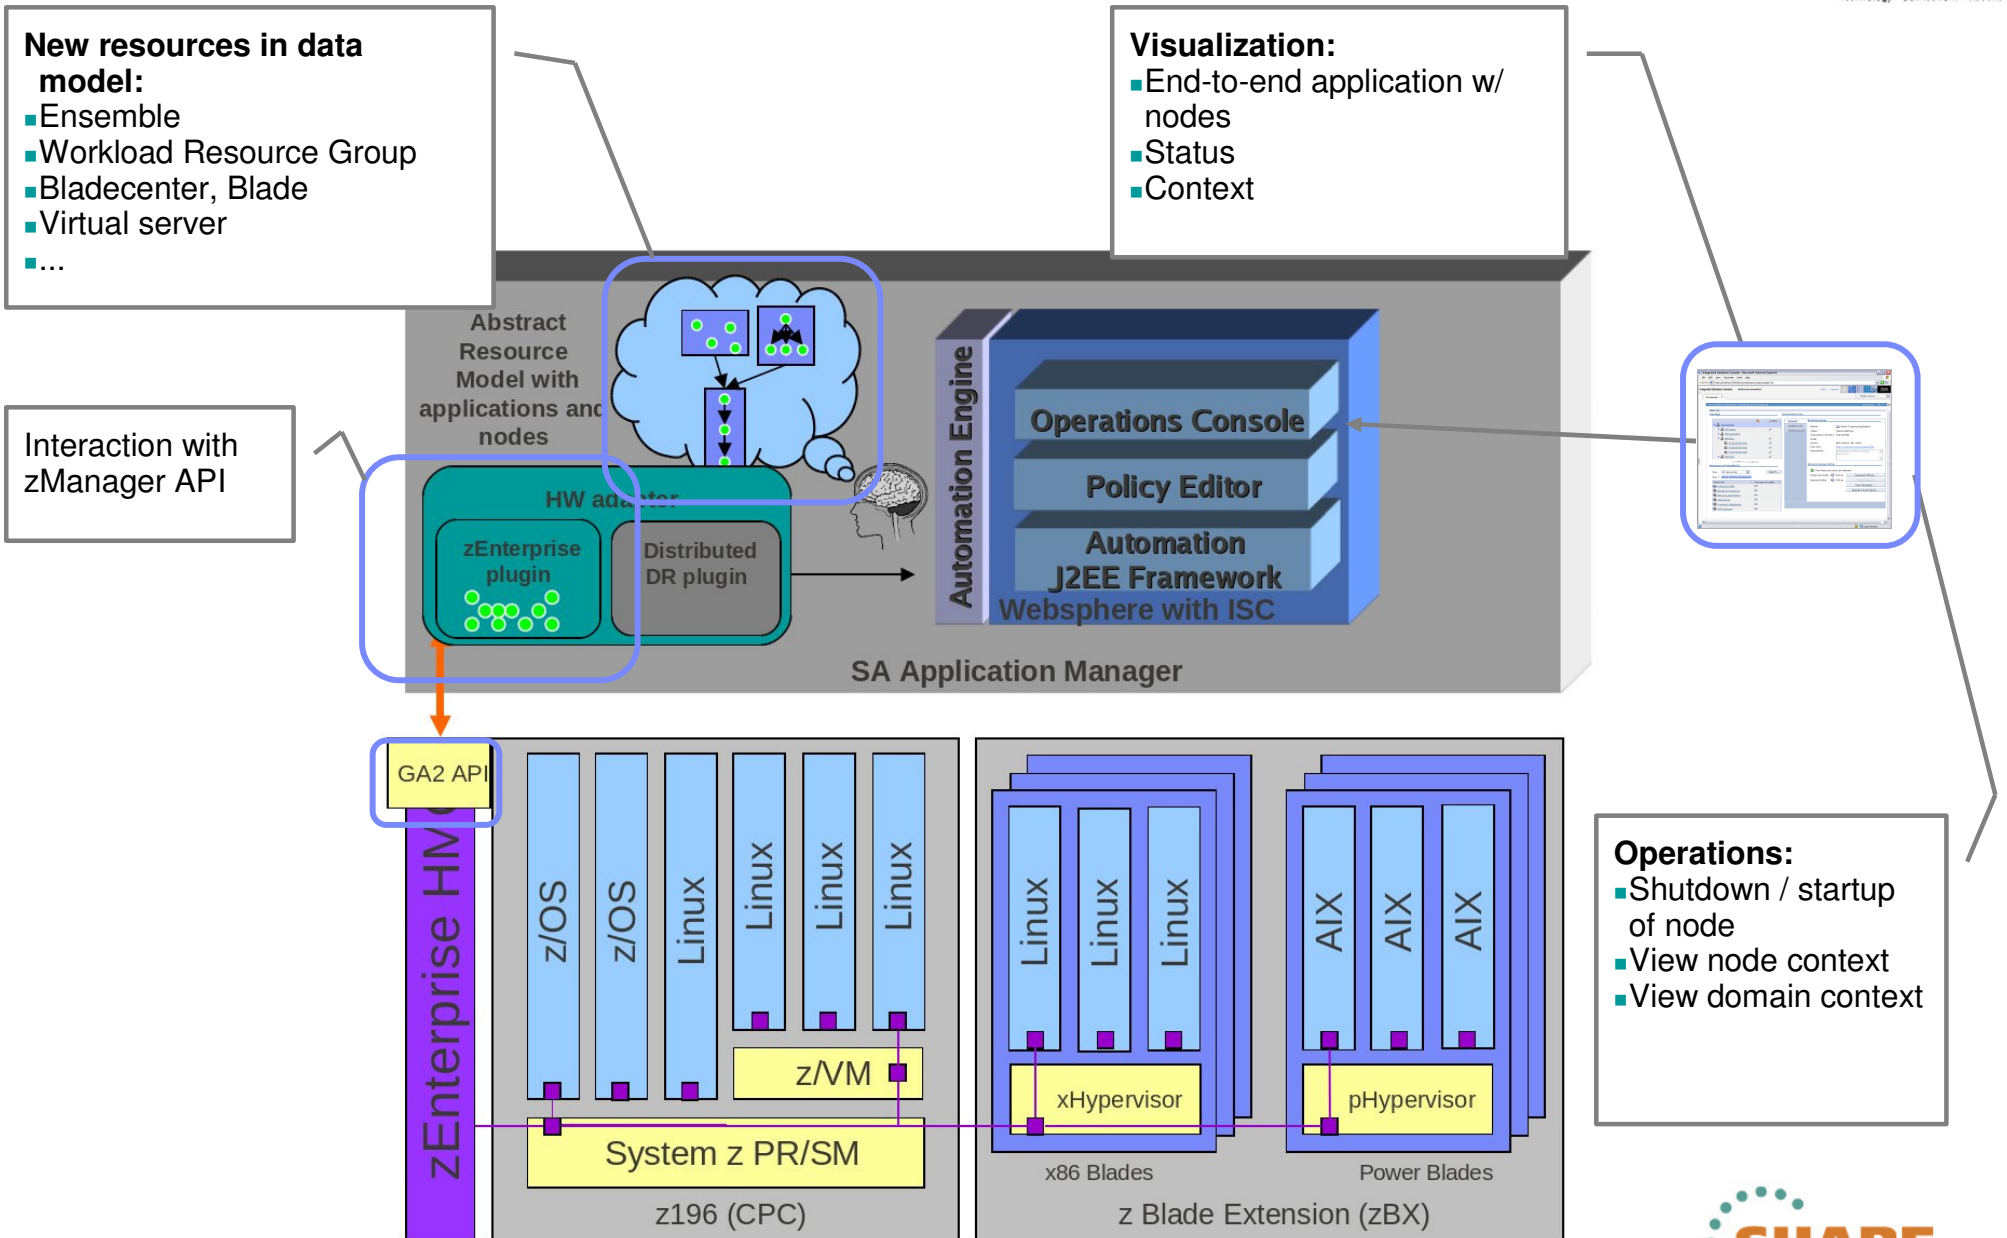

API Usage by System Automation Application Manager

Basic Availability and DR

- SA Application Manager manages multi-tier applications across platforms and is IBM's implementation for GDPS Distributed Cluster Management (DCM)
- Enhancements
 - Awareness of zEnterprise platform resources
 - Support for Unified Resource Manager inventory and status notifications
 - Visualization and control (start/stop) of *SA Nodes* at the operations console
 - Toggle support from primary site to backup site as directed by GDPS
 - Metro distance
 - Unlimited distance
- Value
 - **Reduced operations cost** due to SPOC for operating business applications on virtualized infrastructure
 - Avoids or reduces MTTR in case of application or infrastructure outages

SA AppMan Big Picture

SA AppMan Setup and Prerequisites

Administrator

1. Configure access to zEnterprise HMC
2. Start HW adapter

System Automation Application Manager

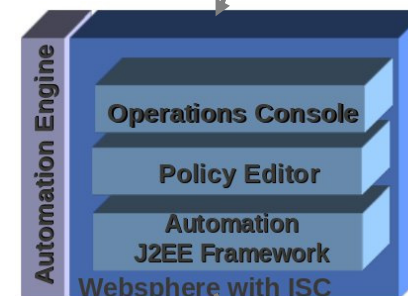

3. Existing First Level Automation nodes are mapped automatically to virtual servers, where applicable

Mapping is based on hostname provided by Unified Resource Manager Web Services API via GPMP

Web-based operations console

4. Platform information is available, startup and shutdown possible, if

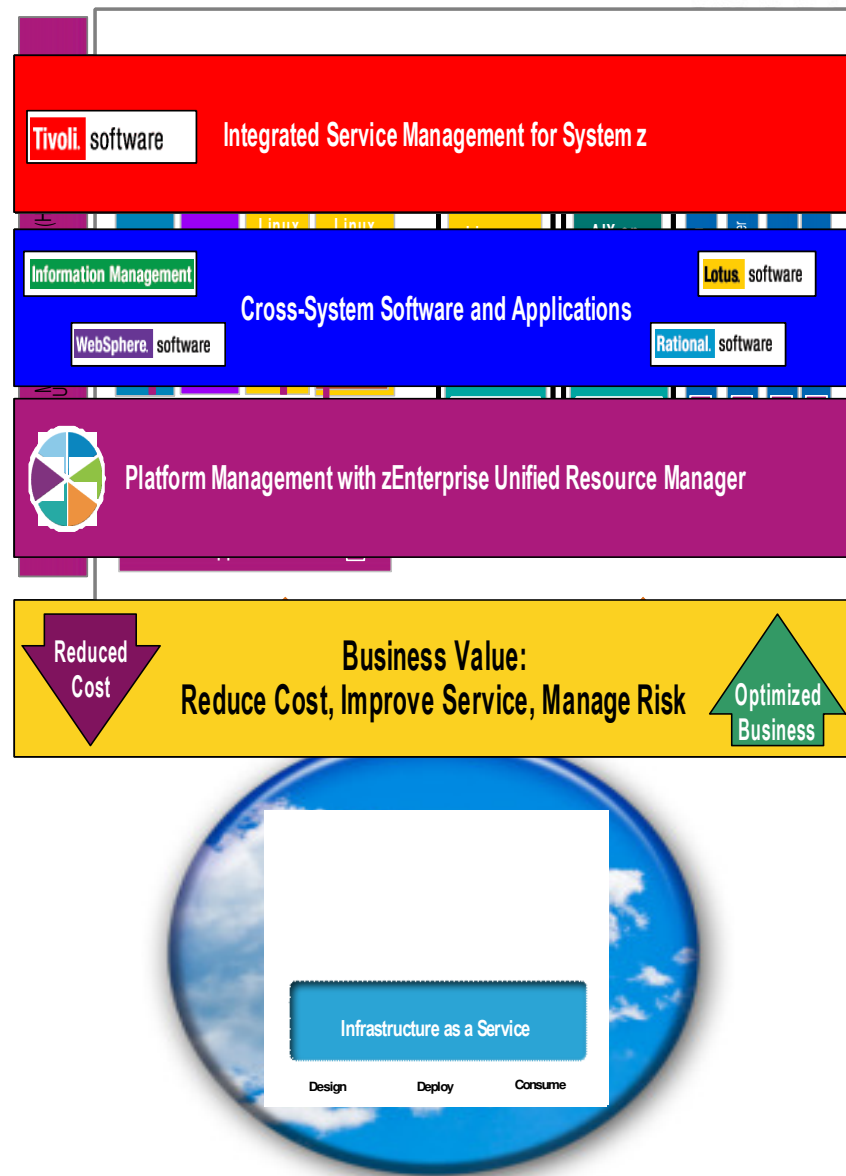

Sample scenarios:

- Manually shutdown a guest that is part of a HA cluster or standalone systems connected via Agentless Adapter to
 - give resources to other nodes on the same virtualization host
 - drain all nodes because of doing hardware maintenance

Summary

- The zManager APIs and exploiting products integrate the zEnterprise platform into end-to-end Integrated Service Management:
 - **Visibility**
 - Discover zEnterprise platform resources and place them in infrastructure, application, and business service contexts
 - Efficient monitoring of resources and integration of monitoring to various service management applications
 - **Control**
 - Productively adjust state of resources for planned and unplanned activities across platforms and networks
 - **Automation**
 - Quickly detect anomalies or accept requests and take programmatic action for notification, bypass/resolution, and planned operations

Tivoli System z Sessions at SHARE

Monday

- 11:00 11207: Automating your IMSplex with System Automation for z/OS Platinum 7
- 1:30 11832: What's New with Tivoli System Automation for z/OS Elite 1
- 3:00 11886: Improve Service Levels with Enhanced Data Analysis Elite 1

Tuesday

- 9:30 11792: What's New with System z Monitoring with OMEGAMON Elite 1
- 11:00 11791: Tuning Tips To Lower Costs with OMEGAMON Monitoring Platinum 8
- 1:30 11900: Understanding Impact of Network on z/OS Performance Grand Salon A

Wednesday

- 9:30 11835: Automated Shutdowns using either SA for z/OS or GDPS Elite 1
- 1:30 11479: Predictive Analytics and IT Service Management Grand Salon E/F
- 1:30 11899: Top 10 Tips for Network Perf. Monitoring w/ OMEGAMON Platinum 9
- 4:30 11836: Save z/OS Software License Costs with TADz Elite 1

Thursday

- 9:30 11905: Using NetView for z/OS for Enterprise-Wide Mgmt and Auto Grand Salon A
- 11:00 11909: Get up and running with NetView IP Management Grand Salon A
- 11:00 11887: Learn How To Implement Cloud on System z Grand Salon E/F

Friday

- 9:30 11630: Getting Started with URM APIs for Monitoring & Discovery Elite 1
