Trademarks

The following are trademarks of the International Business Machines Corporation in the United States, other countries, or both.

z/VM® z10™ z/Architecture® zEnterprise™ System z196 System z114

Not all common law marks used by IBM are listed on this page. Failure of a mark to appear does not mean that IBM does not use the mark nor does it mean that the product is not actively marketed or is not significant within its relevant market.

Those trademarks followed by ® are registered trademarks of IBM in the United States; all others are trademarks or common law marks of IBM in the United States.

For a complete list of IBM Trademarks, see www.ibm.com/legal/copytrade.shtml:

The following are trademarks or registered trademarks of other companies.

Adobe, the Adobe logo, PostScript, and the PostScript logo are either registered trademarks or trademarks of Adobe Systems Incorporated in the United States, and/or other countries.
Cell Broadband Engine is a trademark of Sony Computer Entertainment, Inc. in the United States, other countries, or both and is used under license therefrom.
Java and all Java-based trademarks are trademarks of Sun Microsystems, Inc. in the United States, other countries, or both.
Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.
Intel, Intel logo, Intel Inside, Intel Inside logo, Intel Centrino, Intel Centrino logo, Celeron, Intel Xeon, Intel SpeedStep, Itanium, and Pentium are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.
UNIX is a registered trademark of The Open Group in the United States and other countries.
Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.
ITIL is a registered trademark, and a registered community trademark of the Office of Government Commerce, and is registered in the U.S. Patent and Trademark Office.
IT Infrastructure Library is a registered trademark of the Central Computer and Telecommunications Agency, which is now part of the Office of Government Commerce.

* All other products may be trademarks or registered trademarks of their respective companies.

Notes:

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

IBM hardware products are manufactured from new parts, or new and serviceable used parts. Regardless, our warranty terms apply.

All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.

This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.

All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.

Disclaimer

The information contained in this document has not been submitted to any formal IBM test and is distributed on an "AS IS" basis without any warranty either express or implied. The use of this information or the implementation of any of these techniques is a customer responsibility and depends on the customer's ability to evaluate and integrate them into the operational environment. While each item may have been reviewed by IBM for accuracy in a specific situation, there is no guarantee that the same or similar results will be obtained elsewhere. Customers attempting to adapt these techniques to their own environments do so at their own risk.

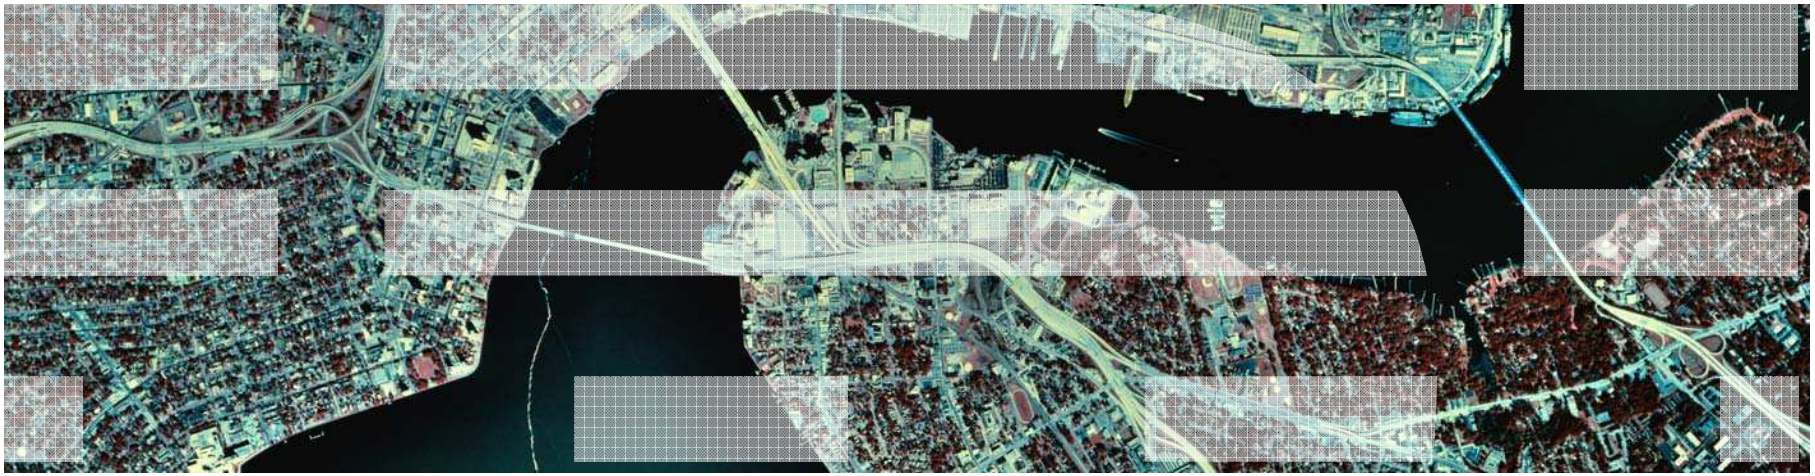
In this document, any references made to an IBM licensed program are not intended to state or imply that only IBM's licensed program may be used; any functionally equivalent program may be used instead.

Any performance data contained in this document was determined in a controlled environment and, therefore, the results which may be obtained in other operating environments may vary significantly. Users of this document should verify the applicable data for their specific environments.

It is possible that this material may contain reference to, or information about, IBM products (machines and programs), programming, or services that are not announced in your country. Such references or information must not be construed to mean that IBM intends to announce such IBM products, programming or services in your country.

Agenda

- Planning for Live Guest Relocation (LGR)
- Relocation Domains
- Performing Live Guest Relocations
- Helpful Hints



Planning
for
Live Guest Relocation

General Guidelines for Relocating a Guest

Make sure all resources used by the virtual machine are available on the destination member

- Devices
- Facilities (will be handled automatically if you are relocating within a domain)
- Crypto cards
- Capacity for the virtual machine's memory and processor requirements
- Equivalency ids (**EQID**s) are defined for devices that need them
  - OSAs and FCPs
- Make sure that the devices really are equivalent
    - OSAs should be connected to the same LAN segment
    - FCPs should have access to the same SAN fabric
    - WWPNs and LUNs
  - If possible, use the same device numbers to refer to equivalent devices
- If connected to a VSWITCH, make sure the same VSWITCH is defined on the destination and the OSAs have been assigned EQIDs.
- If the virtual machine has an FCP, make sure the “queue_if_no_path” option is specified in Linux
- **OPTION CHPIDVIRTUALIZATION ONE** should be specified in guest's directory entry

Guest Configuration for Live Guest Relocation

- In order to be eligible to relocate, a guest must be:
  - Defined as a single configuration virtual machine
  - Running in an ESA or XA virtual machine in ESA/390 or z/Architecture mode
  - Logged on and disconnected
  - Running only type CP or type IFL virtual processors

- If a guest is using a DCSS or NSS:
  - Identical NSS or DCSS must be available on the destination member
  - It cannot have the following types of page ranges
    - SW (shared write)
    - SC (shared with CP)
    - SN (shared with no data)

Guest Configuration for Live Guest Relocation (cont.)

- A guest can relocate if it has any of the following:
  - Dedicated devices
    - Equivalent devices and access must be available on destination member
  - Private virtual disks in storage (created with DEFINE VFB-512 command)
  - No open spool files other than console files
  - VSWITCHes
    - Equivalent VSWITCH and network connectivity must be available on destination

- A relocating guest can be using any of the following facilities:
  - Cryptographic adapter
    - Crypto cards for shared domains on source and destination must be same AP type
  - Virtual machine time bomb (Diag x'288')
  - IUCV connections to *MSG and *MSGALL CP system services
  - Application monitor record (APPLDATA) collection
    - If guest buffer is not in a shared DCSS
  - Single Console Image Facility
  - Collaborative Memory Management Assist (CMMA)

Memory Requirements for Live Guest Relocation

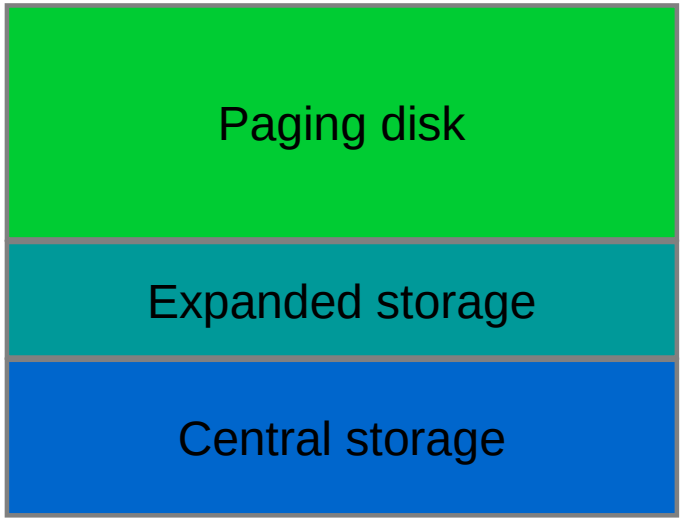
- A relocating guest's current memory size ***must*** fit in available space on the destination member

Guest's Current Memory Size

Virtual memory fully populated, including
- Private Vdisks
- Estimated size of supporting CP structures

<

Available space
- sum of available memory



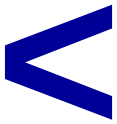
Memory Requirements for Live Guest Relocation…

- Additional checks

1. Does the guest's current memory size exceed paging capacity on the destination?

Guest's Current Memory Size

Virtual memory fully populated, including
- Private Vdisks
- Estimated size of supporting CP structures



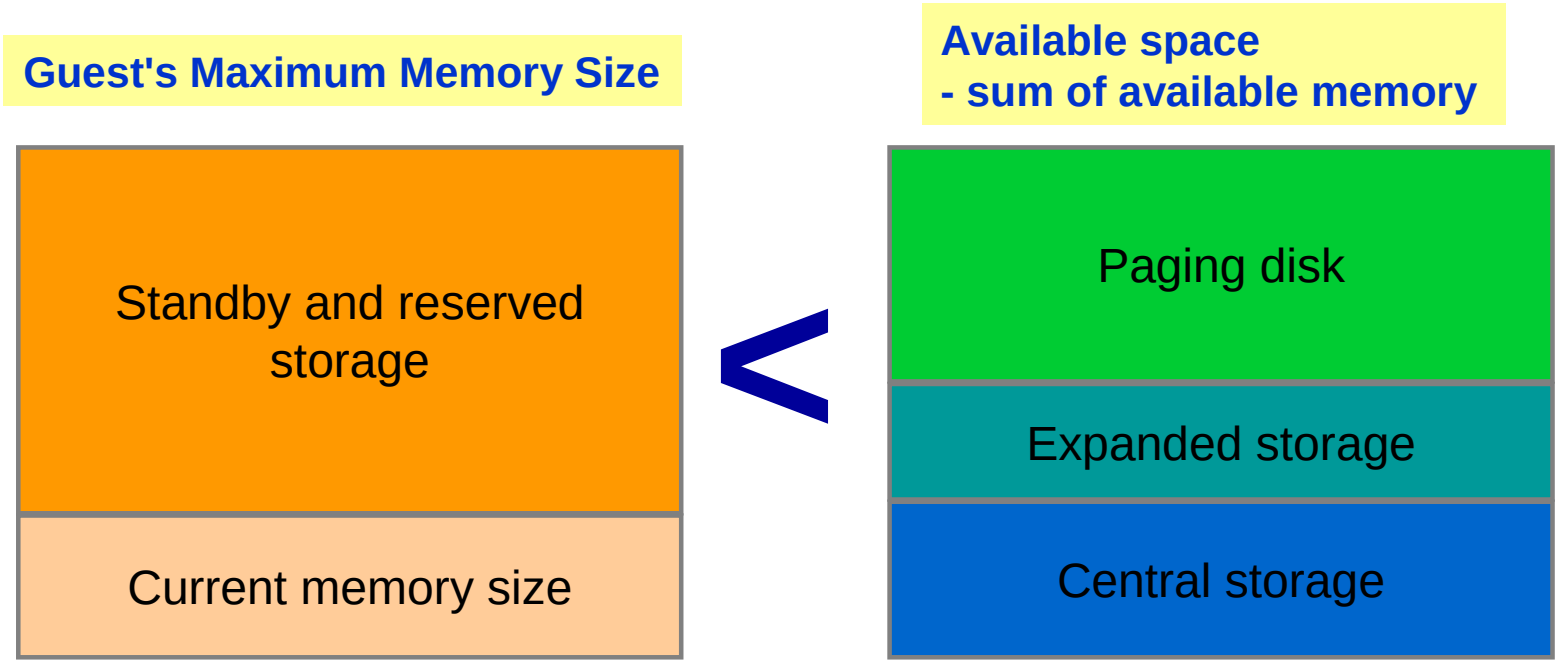
Paging disk capacity

May be overridden if you are certain that this is not applicable to your environment

Memory Requirements for Live Guest Relocation…

- Additional checks

2. Does the guest's maximum memory size exceed available space on the destination?

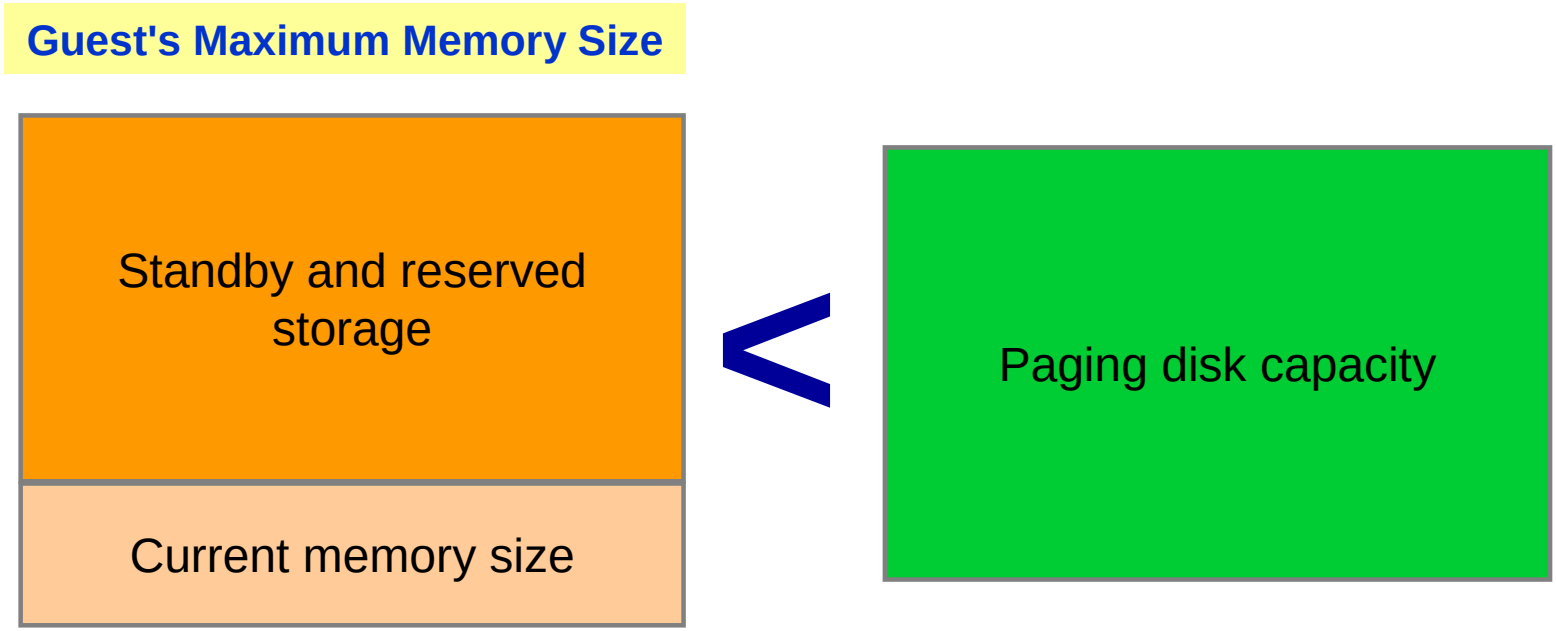


May be overridden if you are certain that this is not applicable to your environment

Memory Requirements for Live Guest Relocation…

- Additional checks

3. Does the guest's maximum memory size exceed paging capacity on the destination?



May be overridden if you are certain that this is not applicable to your environment

Memory Requirements for Live Guest Relocation…

- Include standby and reserved storage settings when calculating maximum memory size for a guest

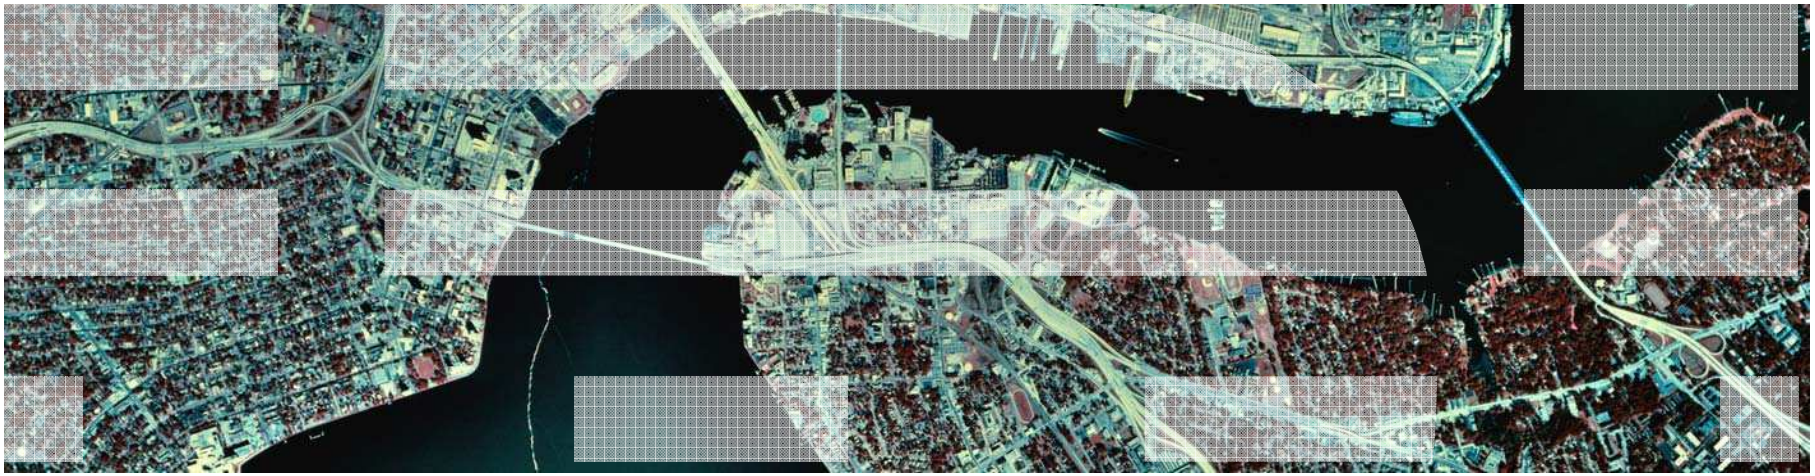
- Relocations may increase paging demand
  - Available paging space should be at least 2x total virtual memory of all guests
    - Including guests to be relocated to this member
  - Avoid allocating more than 50% of available paging space
    - If size of guests to be relocated increase in-use amount to > 50%, system performance could be affected

```
q alloc page

                EXTENT     EXTENT  TOTAL  PAGES   HIGH    %
VOLID  RDEV      START        END  PAGES IN USE   PAGE USED
------ ---- ---------- ---------- ------ ------ ------ ----
L24B66 4B66          0       3338 601020 252428 252428   42%
```

Conditions That Prevent a Relocation

- Conditions in the following categories could prevent a relocation from completing:
  - Guest State Conditions
  - Device Conditions
  - Device State Conditions
  - Virtual Facility Conditions
  - Configuration Conditions
  - Resource Limit Conditions
  - Other…
- Entire list of conditions documented in CP Planning and Administration
  - "Preparing for Live Guest Relocation in a z/VM SSI Cluster"

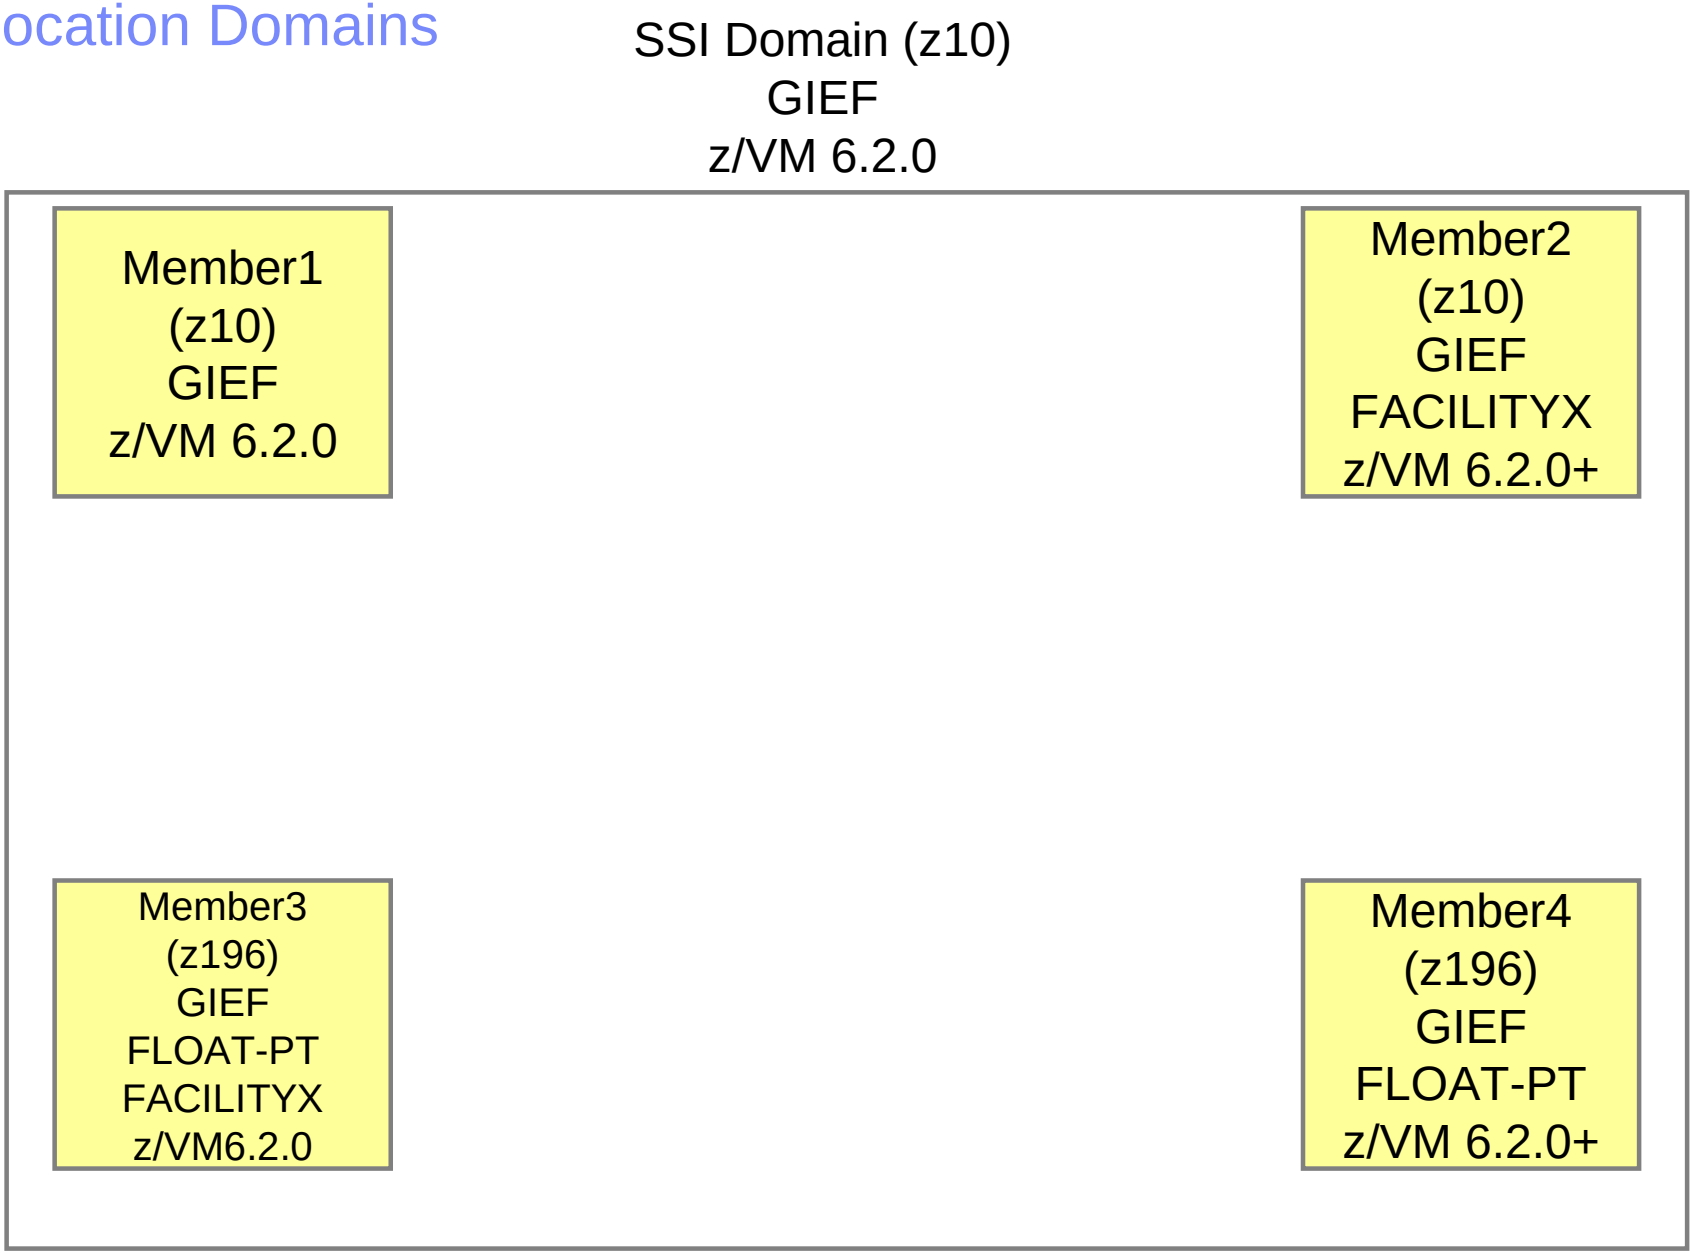


Relocation Domains

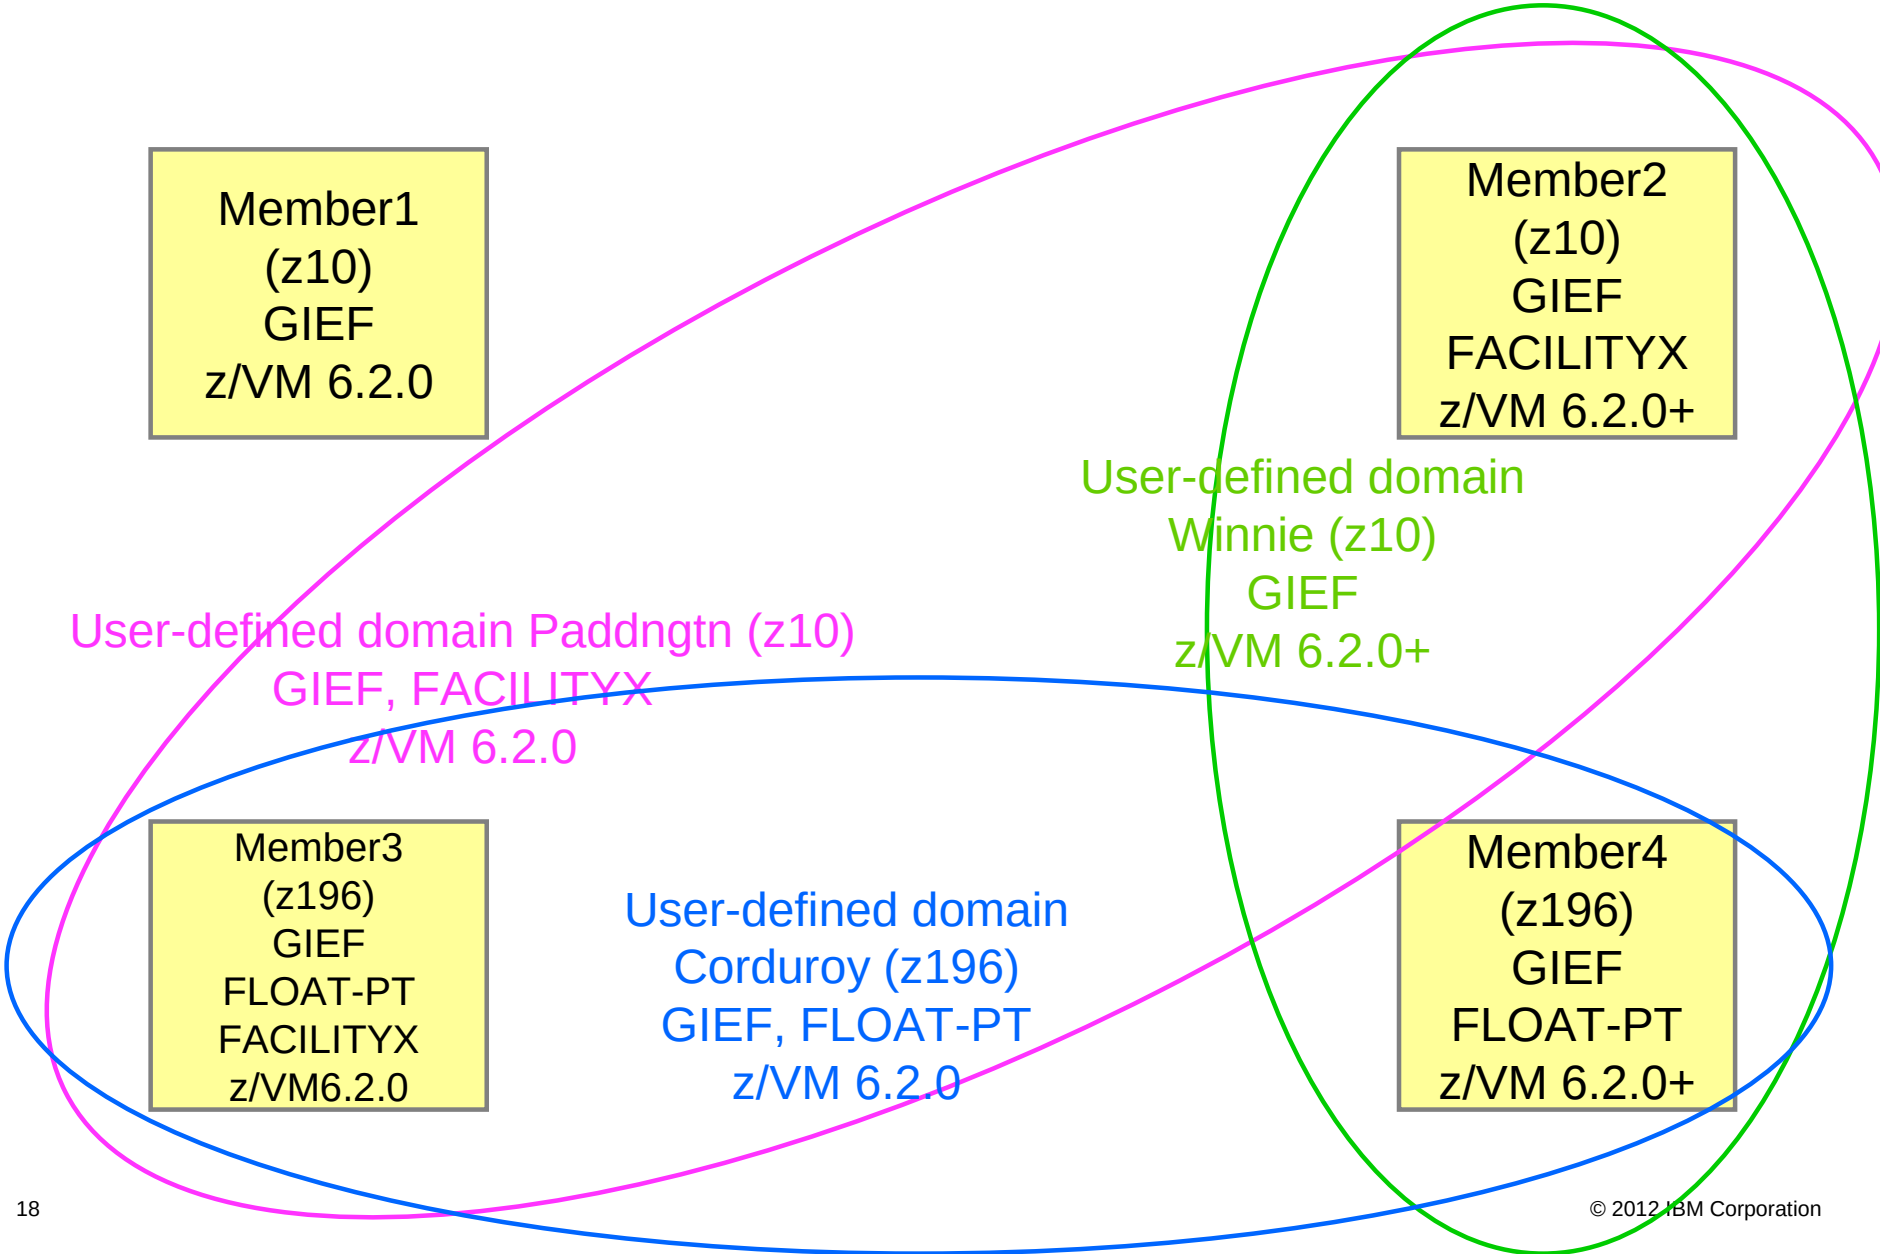
What is a Relocation Domain?

- A relocation domain defines a set of members of an SSI cluster among which virtual machines can relocate freely
- Relocation domains can be defined for business or technical reasons
- Regardless of differences in the facilities of the individual members, a domain has a common architectural level
  - This is the maximal common subset of all the members' facilities
- Several default domains are automatically defined by CP
  - Single member domains for each member in the SSI
  - An SSI domain that will have the features and facilities common to all members
- Defining your own domains is useful in a 3+ member cluster
  - In a 1 or 2 member cluster, all possible domains are defined by default

Relocation Domains



Relocation Domains



Defining Relocation Domains

- In system configuration file:

```
88
89 RELOCATION_DOMAIN PADDNGTN MEMBER2 MEMBER3
90 RELOCATION_DOMAIN WINNIE MEMBER2 MEMBER4
91 RELOCATION_DOMAIN CORDUROY MEMBER3 MEMBER4
92
```

- Dynamically via a **DEFINE** command:

```
define relodomain paddngtn members member2 member3

define relodomain winnie members member2 member4

define relodomain corduroy members member3 member4
```

Assigning Relocation Domains

- Virtual machines may be assigned to a domain in their directory entry
  - Default for single configuration virtual machines is the SSI domain
  - Default for multiconfiguration virtual machines is their single member domain, which cannot be changed

- Virtual machines are assigned a virtual architecture level when they log on, according to what domain they are in

- They cannot use facilities or features not included in the domain even if the member they are on has access to those features
  - We call this “fencing”

- Examples of commands/instructions with “fenced” responses:
  - **Q CPUID** -the model number will always reflect the virtual architecture level, the processor number is set at logon and not affected by relocation or relocation domain changes
  - **Diagnose x'00'** – will reflect the virtual CPLEVEL
  - **STFLE**

Assigning Relocation Domains - Directory

```
dirm for lgrrh56 vmrelocate on domain winnie

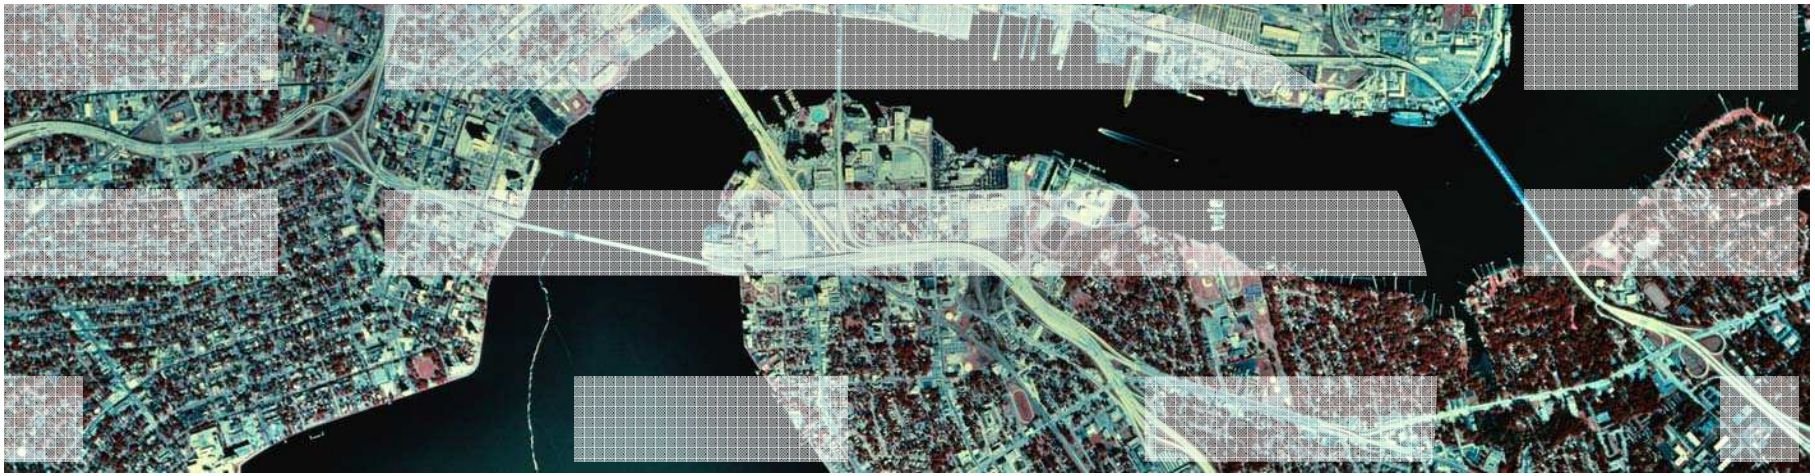
   MDISK 0151 3390 1 END FL4BC9 MR ALL WRITE MULTI
   MDISK 0152 3390 1 END FL4BCA MR ALL WRITE MULTI
```

Assigning Relocation Domains - Dynamic

- A running virtual machine may be dynamically reassigned to a domain with the same or greater facilities, so long as the member he is currently on has access to those facilities
- For example, a guest may be in the SSI domain, but relocate to a member with access to more facilities, so you may want to reassign him to a domain with higher facilities

```
set vmrelocate * domain ssi
Running on member GDLRCTS2
Relocation enabled in Domain SSI
Ready;
q cpuid
CPUID = FF3B6D8520978000
Ready;
define relodomain winnie gdlrcts1 gdlrcts2
Ready;
set vmrelocate * domain winnie
Running on member GDLRCTS2
Relocation enabled in Domain WINNIE
Ready;
q cpuid
CPUID = FF3B6D8528178000
Ready;
```



Live Guest Relocation

Starting and Managing a Live Guest Relocation

- New **VMRELOCATE** command
  - Several operands to start and monitor relocations, including:
    - **TEST** – determine if guest is eligible for specified relocation
    - **MOVE** – relocates guest
      - **MAXQUIESCE** – maximum quiesce time (relocation is cancelled if exceeded)
      - **MAXTOTAL** – maximum total time (relocation is cancelled if exceeded)
    - **STATUS** – display information about relocations that are in progress
    - **CANCEL** – stop a relocation

What to Know Before Starting Relocations

- Guests are relocated in several stages
- A relocation can be canceled at any time until after the guest's final state is moved
  - **VMRELOCATE CANCEL** command from the source or destination
  - **CPHX** will cancel a **VMRELOCATE SYNC** command
- If there are any eligibility failures at any point until after the guest's final state is moved, the relocation cancels
- The guest continues to run on originating member if a relocation fails or is cancelled

What to Know Before Starting Relocations…

- Use the **VMRELOCATE TEST** command before you try a **VMRELOCATE MOVE**

- Choose one class A user to always issue your **VMRELOCATE** commands
  - Only issue one **VMRELOCATE** command at a time
    - Default **SYNCHRONOUS** option to enforce one-at-a-time relocations

- Use the **AT** command to issue **VMRELOCATE**s on another member in your SSI cluster

- Know how long your Linux machine can be quiesced, look at applications and when they will timeout (30 seconds? 5 seconds?)
  - Use the **MAXQUIESCE** option to tell CP how long quiesce time can be
  - If this is exceeded, the relocation will be canceled and the virtual machine resumed on the source member

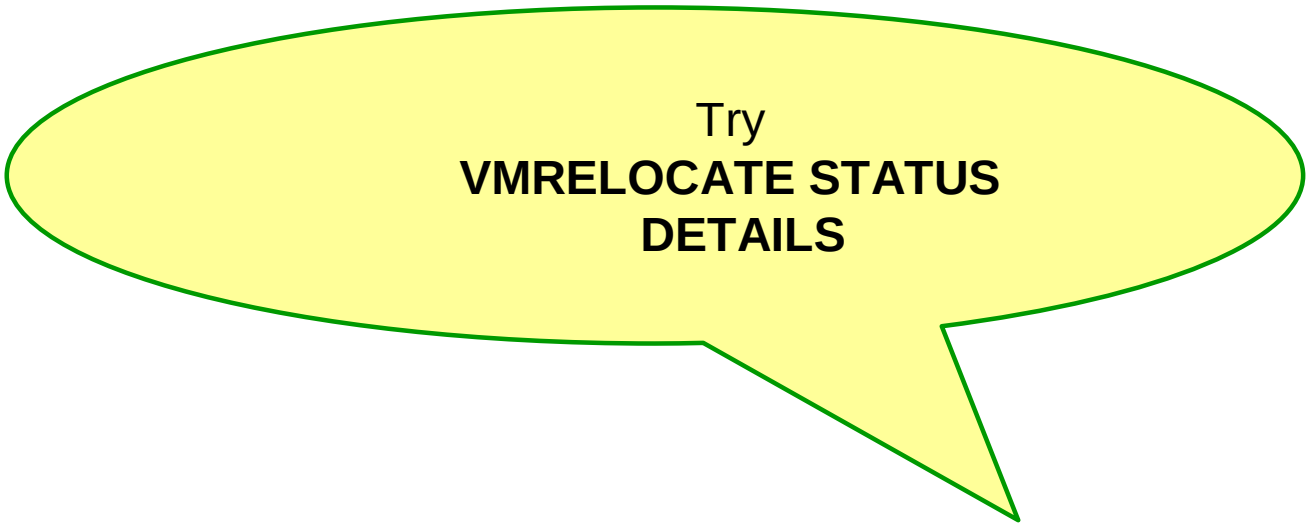
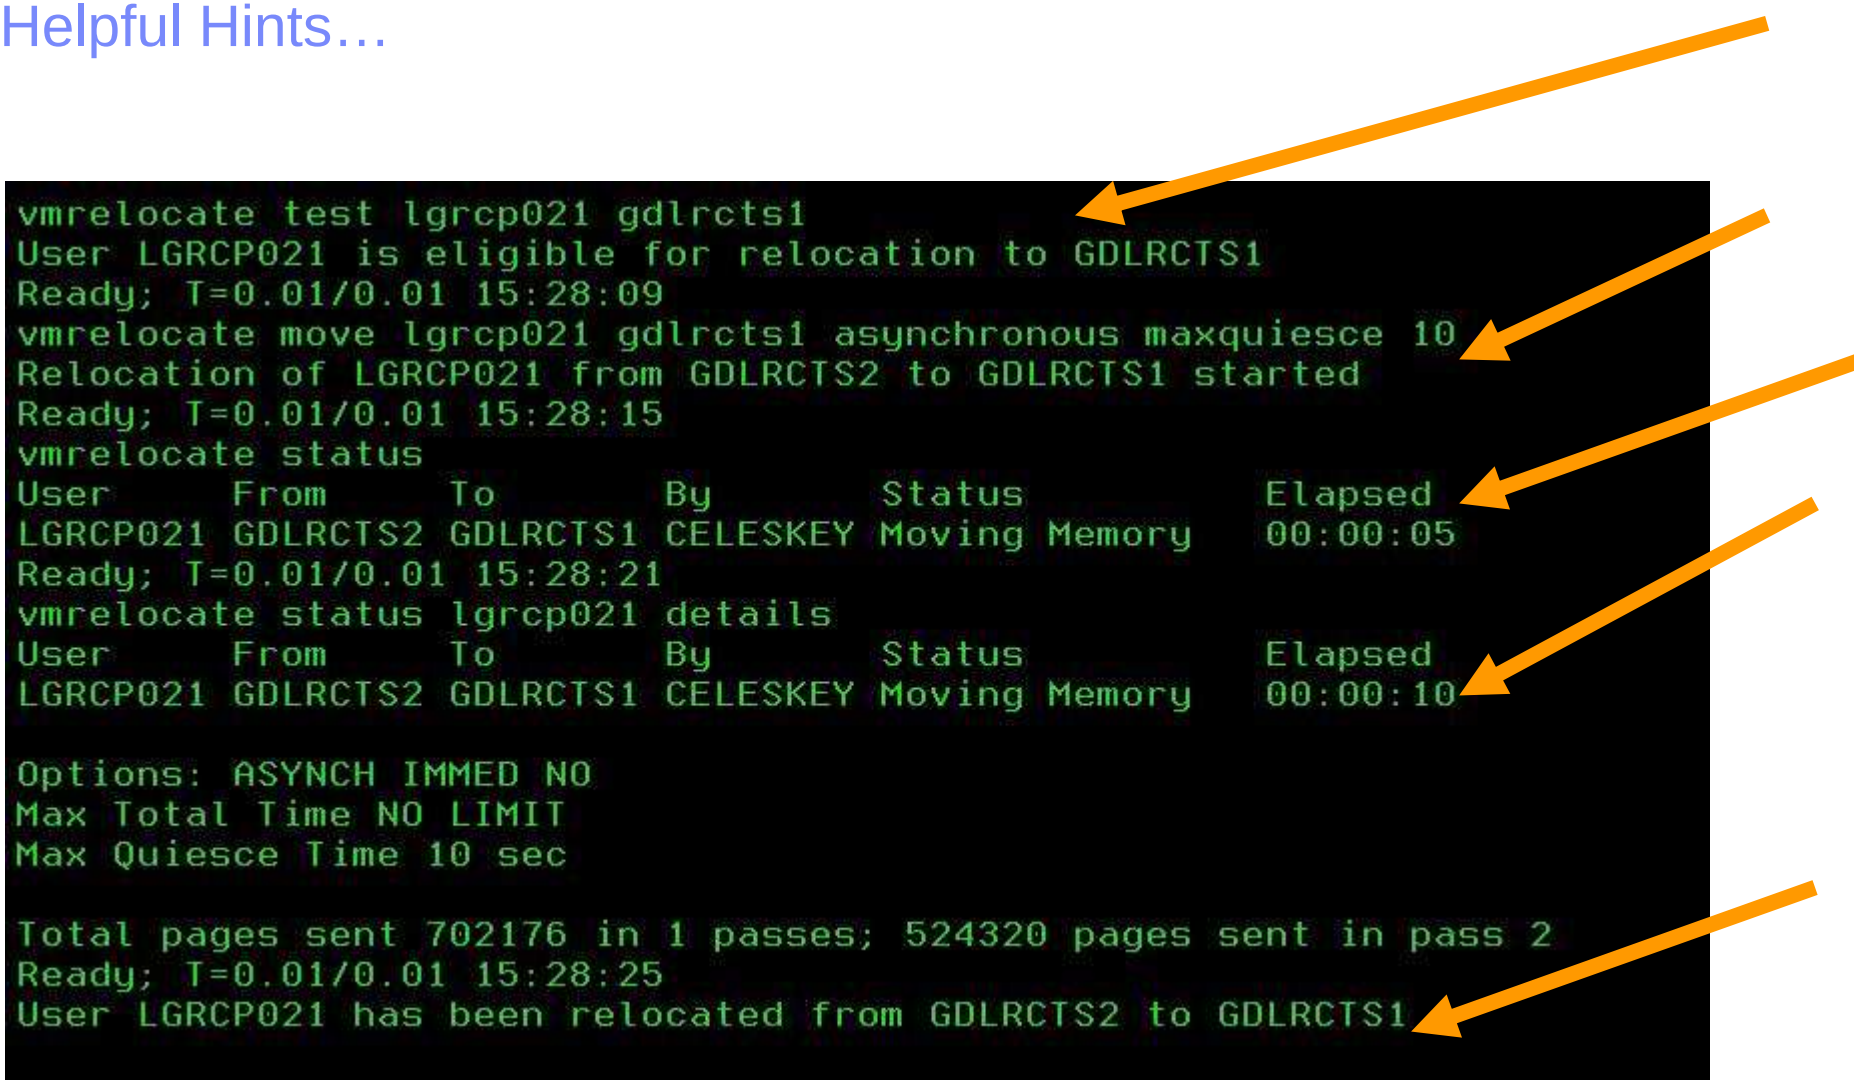
Helpful Hints



Helpful Hints…



Helpful Hints…

Help! My relocation always exceeds my quiesce time!

Are you issuing relocations one at a time?

Check system constraints, are you trying to relocate to a member that really can't handle another user?

How many CTCs do you have between your members? How fast are they? How many devices do you have on each CHPID?

Helpful Hints…

I don't trust that you're really leaving the guest running, I want to see what my guest is doing as he relocates!

Use SCIF from another single configuration virtual machine -
SET OBSERVER LINUX01 *

Have the virtual machine spool his console
SPOOL CONS * START

Connect to Linux via SSH or VNC

Helpful Hints…

What are all these messages I see on my Linux console after relocation?

You may see recovery messages for OSA or FCP devices after relocation, this is normal
