Topics

• What is an I/O Configuration?
• Benefits of Dynamic I/O Configuration
• What is Dynamic I/O Configuration on z/VM
• Elements of Dynamic I/O Configuration
• Preparing for Dynamic I/O
• Dynamically Changing your I/O Configuration
  • z/VM HCD & HCM only
  • z/OS HCD & z/VM HCD
  • Native VM commands
• Conclusions
• Questions?
What is an I/O Configuration?

- Definition of Resources that are available to the processor complex
  - Resources include:
    - Machine type
    - Logical Channel Subsystems (LCSS)
    - Logical Partitions (LPARs)
    - Channel Paths (CHPIDs)
    - Control Units (CNTLUNIT or CU)
    - Devices (IODEVICE; often referred to as UCB in software)
  - Two views
    - Hardware in the Channel Subsystem (CSS)
      - Hardware System Area (HSA)
      - Stored in I/O Configuration Dataset (IOCDS)
    - Software in the Operation System Configuration (OSCONFIG)
Benefits of Dynamic I/O Configuration

- Avoid unnecessary outage to change hardware configuration
  - Add new hardware
  - Remove hardware
  - Change configuration
    - Paths, Switches, etc
- Manage configuration for all LPARs on a Central Processor Complex (CPC)
What is Dynamic I/O Configuration

- Modify the hardware I/O definitions (IOCDS) without an outage
  - Native VM CP commands
    - Since VM/ESA Version 2 Release 1.0 – GA October 1995
    - Commands based on hardware requirements
    - Add, change, delete CHPID, CNTRLUNIT, IODEVICE
  - Modify the software view of I/O definitions
    - *Reset I/O control blocks*
      - Devices that do not support Sense commands
      - Clear control blocks of devices with errors

- VM HCD and HCM
  - Since z/VM Version 4 Release 4.0 – GA August 2003
Comparisons Between Native VM CP Commands and HCD

- Amount of detail required in the Input Output Definition File (IODF)
  - VM CP Commands tightly linked to hardware requirements – only
    - z/VM CP manages the software view automatically
      - Automatic changes controlled by z/VM configuration parameters
  - HCD requires additional information
    - OSCONFIG (software view)
      - z/OS HCD requires more than z/VM

- Interface
  - VM CP Commands - simple line commands resemble IOCP statements
  - HCD
    - z/VM: HCM on workstation for changes; REXX for activation, etc
    - z/OS: either ISPF panels or HCM on workstation
Comparisons Between Native VM CP Commands and HCD

• Restriction
  • VM CP Commands permit all changes allowed by hardware
  • HCD imposes restrictions
    • Safeguards in HCD to help avoid mistakes but complicate some valid changes

• Risk
  • VM CP Commands require significant understanding of IOCP and the command syntax
    • Easy to make dynamic changes that don’t exactly match IOCDS
  • HCD helps to prevent mistakes
    • Validation and consistency
Differences

• VM Configuration
  • Each machine has a unique IOCP source
  • Special devices coded in SYSTEM CONFIG
    • Older devices that don’t respond to sense command
    • Devices that require additional configuration
      • e.g. Printers
      • Console information
  • Shared devices not identified
  • Special handling such as offline at IPL

• HCD and HCM
  • All machines in a single view
  • Common IODF has hardware and software view for all included CPCs
  • Shared devices identified
  • Additional information
    • Switch information
Advantages of HCD

• Single point of control
  • Hardware and software definitions both maintained with HCD; Activated using information stored in IODF

• Automatic lock-step approach
  • After successfully performing dynamic changes in the running system, the changes are applied to the prospective IOCDS and written to the Support Element to be available for the next POR

• Automatic backout and recovery capability
  • If an error is encountered anywhere in the process, all changes are backed out.

• Check consistency between hardware and software definitions
  • Guaranteed via unique tokens
Choose how and where to manage I/O configuration

- **z/VM**
  - VM Configuration - CP commands and IOCP
  - Knowledgeable users

- **z/VM HCD and HCM**
  - New users of z/VM (if no z/OS is present)
  - More controlled

**Considerations**

- Cannot mix HCD / HCM with native CP commands
- For the duration of an IPL
- One-time switch from HCD / HCM to native CP commands is possible
- Return to HCD / HCM requires POR

- **z/OS HCD** is needed for any machine that has z/OS LPARs or guests
  - z/VM can use the IODF generated by z/OS HCD
  - z/OS cannot use the IODF generated by z/VM HCD
    - *Not all UIMs supplied or supported in z/VM HCD*
Recommendations

• Use HCD and a single IODF if multiple CPCs share resources

• Use z/OS HCD to manage changes to the IODF if z/OS is present in one or more LPARs in the shared configuration
  • z/VM HCD can still activate the configuration

• Use z/VM HCD to manage changes to the IODF if:
  • You are new to System z and/or don’t want to learn the intricacies of IOCP and the z/VM CP Dynamic I/O commands

• Use z/VM CP Commands if:
  • You really want to learn the fine points of System z hardware
  • You have a machine where you have the flexibility to make changes but can make corrections if needed
Elements of Dynamic I/O Configuration

• Facilities for Enabling dynamic I/O configuration
  • Hardware
  • Software
• IOCP/IOCDS file
• Hardware and Software Functions and Commands
  • HCD and HCM
  • z/VM CP commands
    • Add/Modify/Delete Definitions
      • Channel Paths, Control Units, I/O Devices
    • Select or Change active IOCDS
Elements of Dynamic I/O Configuration

- **SYSTEM CONFIG**
  - CMS file on the PARM disk
  - Enable Dynamic I/O
  - Specify IODF if using HCD to manage hardware view
    - Include OSCONFIG if using HCD to manage software view
  - If not using HCD for software view
    - I/O device definitions (software view of I/O)
  - Additional system-wide options
Enabling Dynamic I/O on Hardware

- Supported on IBM processors since 9021 with VM/ESA Version 2 Release 1 (circa 1994)
- All models with a Hardware Management Console (HMC)
  - Customize Activation Profiles
  - Select your Processor profile
  - View the “Dynamic” 'tab'
  - Check the box for "Allow dynamic changes to the channel subsystem input/output (I/O) definition"
Enabling Dynamic I/O on Hardware

- **Allow One** LPAR to Control I/O for Entire CEC
  - Choose which LPAR will “own” the configuration and make all changes from that LPAR
    - Hardware and software I/O configurations are synchronized using configuration tokens
      - *Tokens are different between HCD and native z/VM CP Commands*
      - *Multiple LPARs using the same token format can make changes – be careful!*
  - All models with a Hardware Management Console (HMC)
    - Customize Activation Profiles
    - Select your LPAR profile
    - View the “Security” 'tab'
    - Check the box for "Input/output (I/O) configuration control"
Hardware Token

● z/VM Token

Query TOKEN
HCPCCO6816E Dynamic I/O changes are not allowed on this system
The target channel subsystem configuration token is:

VM-TOKEN11/03/05 09:46:34 ....08/18/05 23:32:53 PSYS IODF03

● HCD Token

Query TOKEN
HCPCCO6816E Dynamic I/O changes are not allowed on this system
The target channel subsystem configuration token is:
P4 ........d................06-02-1714:07:59 PSYS IODF05
Enabling Dynamic I/O in z/VM

- **SYSTEM CONFIG – HCD**
  - IOF IODF xx [OSCONFIG SYSTEM_CONSole SYSTEM_3270]
    Specify IODF information to z/VM CP

- **SYSTEM CONFIG – CP Commands**
  - Features, Enable,
    DYNamic I/O, Allow hardware I/O changes
    SET_DYNamic_io, Allow use of SET DYNamic ON/OFF command
    SET_DEVices, Allow privileged users to reset CP’s view of real devices
    NEW_DEVices_initialized_when_added
      CP will create a real device control block (RDEV)
      when it receives an I/O machine check (IOMCK)

- **Copy the IODF file to the MAINT CF1 disk**
  - z/VM will not IPL if IODF is specified in SYSTEM CONFIG and the IODF file is not found
One Time Hardware Enablement

- Shutdown VM and all other systems on the processor
- POR (IML / Activate) the processor
  - Must be done once to activate an IOCDS with a valid TOKEN
    - The token is put into the IOCP source by:
      - The z/VM IOCP command
      - HCD generation of an IOCP deck
- Stand-Alone IOCP on all processors later than 9672 CMOS processors can write an IOCDS using a source file with a TOKEN
Using HCD
SYSTEM CONFIG

HCD

• IODF statement
  • IODF\textit{nn}
    • Name of the IODF file to be used
    • Filetype must be PRODIODF
    • Must reside on PARM disk
  • \textit{osconfig}
    Optional specification of VM I/O configuration in the IODF
  • \textit{SYSTEM\_CONSole}
    • Specifies that the Operating System Messages panel on the Hardware Management Console can serve as a system operator console.
    • Can only be used if \textit{osconfig} specified
  • \textit{SYSTEM\_3270}
    • Specifies that the integrated 3270 console on the Hardware Management Console can serve as a system operator console.
    • Can only be used if \textit{osconfig} specified

• Specify only IODF\textit{nn} to cause HCD management of only hardware I/O configuration
• Statements always ignored when IODF specified
  • Subsequent IODF statements (i.e. only the first IODF statement remains valid)
  • FEATURES DISABLE/ENABLE DYNAMIC_IO
  • FEATURES DISABLE/ENABLE SET_DYNAMIC_IO

• Statements ignored when an IODF statement with osconfig is specified
  • RDEVICE
  • DEVICES ACCEPTED/NOTACCEPTED
  • DEVICES DYNAMIC_I/O/NOTDYNAMIC_I/O
  • DEVICES OFFLINE_AT_IPL/ONLINE_AT_IPL
  • DEVICES SENSED/NOTSENSED
  • DEVICES SHARED/NOTSHARED
  • HOT_IO_RATE
  • OPERATOR_CONSOLES
  • EMERGENCY_MESSAGE_CONSOLES
  • FEATURES DISABLE/ENABLE SET_DEVICES
HCD Tasks Using EXECs

- Import IOCP source to HCD
  cbdsmigr iodf03 workiodf a proc1 iocp a i proc1 2817-m32 lpar

- Convert a work IODF to a production IODF
  cbdsprod iodf03 workiodf a iodf03 prodiodf a

- Copy a production IODF to a work IODF
  cbdswork iodf03 prodiodf a iodf04 workiodf a

- Test IODF Activation
  cbdsact iodf03 proc1 [*|os1] (test

- Dynamically activate hardware (and optionally software) configuration
  cbdsact iodf03 proc1 [*|os1] a1

- Generate IOCP source file
  cbdsiocp iodf03 prodiodf a proc1 d cpc1 iocp a [(sa|nosa]

- Generate a report from the IODF
  cbdsrep iodf03 prodiodf a filename listing a X
Make a Change Using z/VM HCD and HCM

• How to import IOCP source to HCD
  cbdsmigr iodf03 workiodf f machine1 iocp a i machine1 9672-x77 lpar
  
  • May require significant modifications to IOCP source to provide information required by HCD
    • Identify common resources
    • Produce accurate and complete connectivity

  • Tags not fully documented
    • $HCD$ and $HCDC$
    • Examples in “z/VM I/O Configuration” manual
    • Some add details
      • *Serial numbers, descriptions, switch input ports, more…*
    • Some add whole definitions
      *$HCD$* SWITCH SWID=67,ADDRESS=67,SERIAL='106412L'
      *$HCDC$* DESC='DCX1 SAN768 NDC67',PORT=((00,FE)),UNIT=2032
      *$HCDC$* SWPORT=((00,77,00),(01,77,01),(10,77,10),(21,77,21),(30,77,30),(31,77,31),(60,77,60),(70,77,70),(71,77,71))

SHARE 120 – Session 12470

This information is for sharing only and is not an endorsement by Nationwide Insurance
Make a Change Using z/VM HCD and HCM

- Import IOCP into a work IODF for HCD OR copy production IODF to work IODF
- Optionally import z/VM SYSTEM CONFIG I/O definitions
- Download the HCM client to a Windows® workstation
  - Install and configure to point to z/VM host
- Start the HCD TCP/IP dispatcher for HCM – cbdsdisp
- Open the IODF in HCM
  - z/VM HCM produces errors using z/OS IODF
    - W CBDA269I No Unit Information Table found for 3390B.
  - Complex multi-CPC IODF is very slow to load
- Make changes using HCM
- Stop the HCD TCP/IP dispatcher – server stop
- Use the HCD cbdsact command to activate the changes
Make a Change Using z/VM HCD and HCM

- HCM graphical rendering may be difficult to use due to complexity
- Zoom may show too little
Make a Change Using z/OS and Activate using z/VM HCD

- Update the IODF using z/OS HCD
  - Create a new work IODF from the latest production IODF
  - Use either ISPF panels of HCM to make the changes
- Export the IODF and transfer to CBDIODSP user-id
- Use the HCD `cbdsact` command to activate the changes
Transfer IODF from z/OS to z/VM

• Use z/OS HCD to EXPORT IODF and send to VM
  • Send via NJE if connected
    • Specify CBDIODSP in the User ID field and the correct NJE Node ID
    • Use RECEIVE command on the CBDIODSP user-id
  • Create a sequential file and send via FTP
    • Specify * in both the User ID and Node ID fields
    • A sequential dataset will be created
    • Use FTP or any other valid method to transfer to CBDIODSP
      • Remember to use binary transfer if an ASCII transfer is in the chain

• The exported z/OS IODF sequential file is the same format as an IODF created or maintained by z/VM HCD
Using CP Commands
SYSTEM CONFIG
CP Commands

• Features section
  • Enable and Disable sections
    What functions can and cannot be used
  • Recommended for Enable
    • Authorize users system-wide to use certain functions
      • SET_DYNamic_i/o, SET_DYNamic_io
        Allow turning Dynamic I/O on and off
      • SET_DEVices
        Allow changing the software view
    • Tell CP whether, and how, to activate certain system functions
      • NEW_DEVices_initialized_when_added
        How to handle hardware MCH interrupts
  • Recommended for Disable
    • Disable Hardware I/O Changes
      • DYNamic_i/o, DYNamic_io
        Allow dynamic changes
      • Dynamic changes can be enabled with CP SET DYN ON when changes will be done
SYSTEM CONFIG extract
CP Commands

/*******************************************************************************
/*                         Features Statement                         */
/*******************************************************************************

Features,
   Enable,
      /* Enable the following features */
      SET_DEVices, /* Allow changing of devices bitmaps */
      SET_DYNamic, /* Allow use of Set Dynamic On/Off Cmd */
      NEW_DEVices_Initialized_When_added, /* Online at IO MCH */
   ...

   Disable,
      /* Disable the following features */
      DYNamic_I/O, /* Disable hdw i/o changes */
SYSTEM CONFIG
CP Commands

• **Rdevice statements**
  - I/O device definitions (software view of I/O)
    - Only necessary for devices which do not respond to sense ID
    - Alter default characteristics for specific devices
      - *Channel-attached Printers*

• How to handle specific devices at initialization
• Which devices to bring online at IPL time
• How to handle hardware I/O interrupts

• All of these are ignored if IODF is in use
SYSTEM CONFIG extract
CP Commands

```c
/**************************************************************************/
/*    Special RDEV statements - things that cannot be sensed            */

NOTACCEPTED,
Safe Dynamic I/O

- Does not apply to HCD / HCM because HCD handles

- Dynamic I/O changes must be implemented in a careful process or you will not be able to activate a new IOCDS and all dynamic changes will be lost at a future machine POR.

- The designers call this a LOCKSTEP process.
  - Plug-and-Play mode available for the adventurous

- I recommend using an EXEC for all commands so that return codes can be checked and no further commands are executed.
How to make a change using z/VM CP commands

- Update the IOCP source statements with proposed changes
- Run **IOCP** EXEC with NOWRT option to check syntax
  - Do not load or activate
- Use a “compare” utility to show the differences between old and new IOCP decks
- Code the necessary CP commands into an EXEC
- Issue CP commands to dynamically make changes
  - **NOTE**: If any command fails, keep track of what was completed. Either reverse the completed commands or fix the failed commands. Write either the old or a new IOCP to a new IOCDS and activate it.
- If commands complete successfully, run **IOCP** EXEC again with write option to create an IOCDS
- Issue **CP SET IOCDS_active** command to activate the new IOCDS
  - This will change the hardware pointer so that the new IOCDS is selected at a future POR.
Verify Dynamic is Enabled

• Verify that Dynamic I/O changes are allowed
  
  Query DYN
  Dynamic I/O changes are not allowed on this system

• Why?
  
  • Features Disable DYNamic I/O is in my SYSTEM CONFIG
  
  • Enable it:
    
    CP SET DYNamic ON
    System is now enabled for dynamic I/O changes

• Verify that Dynamic I/O changes are allowed
  
  Query DYN
  Dynamic I/O changes are allowed on this system
IOCP Statements

- **CHPID Statement**

- **CNTLUNIT Statement**

- **IODEVICE Statement**
IOCP Statement Relationship

CHPID00  CHPID PATH=(00),TYPE=CNC
DASDCU01  CNTLUNIT CUNUMBR=0001,PATH=(00),UNIT=3390
DASD0001  IODEVICE ADDRESS=(1000,256),CUNUMBR=(0001),STADET=Y,UNIT=3390
Adding a String of DASD

- IOCP statements being added (from some compare process)

  CHPID PATH=(05), SHARED, PARTITION=((MVS1, VM1, VM2), (MVS1, VM1, VM2)), SWITCH=01, TYPE=CNC
  CHPID PATH=(31), SHARED, PARTITION=((MVS1, VM1, VM2), (MVS1, VM1, VM2)), SWITCH=01, TYPE=CNC
  CHPID PATH=(89), SHARED, PARTITION=((MVS1, VM1, VM2), (MVS1, VM1, VM2)), SWITCH=02, TYPE=CNC
  CNTLUNIT CUNUMBR=1340, PATH=(05, 89), UNITADD=((00, 128)), LINK=(A1, A1), UNIT=3990
  CNTLUNIT CUNUMBR=1440, PATH=(31), UNITADD=((00, 128)), LINK=(E1), UNIT=3990
  IODEVICE ADDRESS=(4000, 128), CUNUMBR=(1340, 1440), STADET=Y, UNIT=3390

- Commands to verify syntax of new (complete) IOCP source file
  - IOCP NEWIOCP2 (NOWRT DYN LPAR)
Adding a String of DASD

• Commands (in an EXEC)

/* Dynamically add a string of DASD */
Address 'COMMAND'
'CP SPOOL CONSOLE TO * START NAME DYNAMIC IOCP'
Signal On Error

Adding a String of DASD

• Query the paths to the device

  Query PATHS 4000

  Device 4000, Status ONLINE
  CHPIDs to Device 4000 (PIM) : 05 31 89
  Physically Available (PAM) : + − −
  Online (LPM) : + − −

  Legend + Yes − No
Conclusions
Conclusions

• When z/OS is present on the CPC
  • Use z/OS to maintain the IODF and IOCDS
  • Use z/VM dynamic capability to sense hardware changes and dynamically manage its software I/O configuration

• When z/OS is at the site and there are shared I/O resources
  • Use z/OS to maintain the IODF
  • Export the IODF to z/VM and use z/VM HCD to update HSA and the IOCDS
  • Use z/VM dynamic capability to sense hardware changes and dynamically manage its software I/O configuration

• For stand alone CPC and/or new to z/VM
  • Use z/VM HCD and HCM
    • Limited examples
    • Limited customer exploitation

• For experienced (or adventurous) user
  • Use IOCP and Native z/VM commands
    • NOTE: No safeguards; Errors are easy to make
