Just in Time Capacity Planning

- The Beginning
 - Brief Background
 - Capacity Planner - 20+ years
 - Worked in a variety of industries
 - *Insurance*
 - *Airline*
 - *Consumer Credit*
 - *Hospital / Educational*
 - *Outsourcing*
 - *Retail*

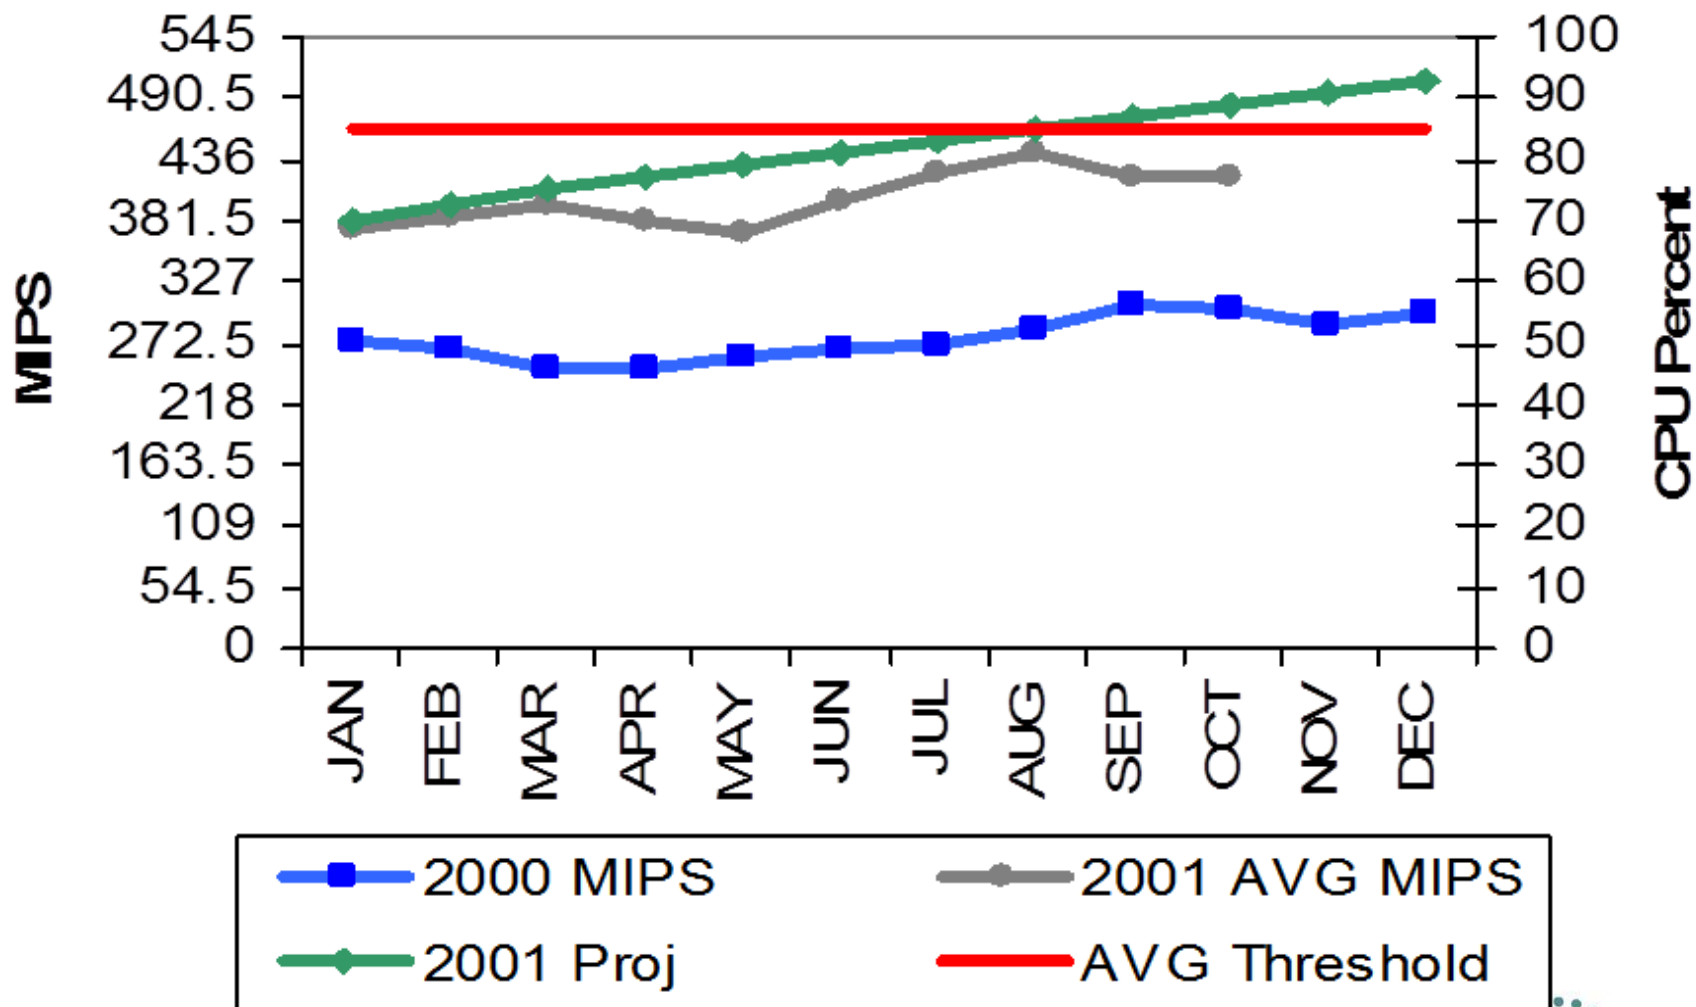

Just in Time Capacity Planning

- The Beginning of Capacity Planning
 - Art vs Science
 - Crystal Ball
 - Methodology
 - Monthly Charts
 - Straight Trend Lines
 - Forecast
 - *Look at the past*
 - *Collect information from applications (if possible)*
 - Linear Regression

Just in Time Capacity Planning

Traditional View of Capacity Data

Just in Time Capacity Planning

- Weekly View versus Monthly View
 - The Monthly view of the data obscures variations in the seasonal cycle.
 - The Weekly view allows the capacity planner to see smaller trends and variations that occur at the approximate same time each year.
 - Drill down further?
 - Ability to go to a lower level such as daily view of the world

Just in Time Capacity Forecasting

- The Challenge
 - Is there a way to show the seasonal variations in a capacity forecast?
 - Were there measurable variations on a weekly basis that could be captured?
 - If so, could this be used to create a capacity forecast?
 - Can it be used across various types of businesses?
 - Even with changes in the environment, do the same peaks/valleys occur on the same week each year?
 - Maintainability?

Just in Time Capacity Planning

- Technique
 - Use of the Spreadsheet
 - What is the unit of measure? MIPS, Hours, or something else
 - Is there a pattern that can be discerned on a week to week basis over the span of one year to several years?
 - Example – does utilization go down or up at the same approximate week each year?
 - Can linear regression still be used and combined with the seasonal forecast to deliver an accurate forecast?
 - Are there other factors that need to be considered?
 - The foundation can be found in the Proceedings for Share 2007 and CMG 2006.

= Current week MIPS / Previous week MIPS

| WEEK | MIPS | | | | | | Diff from prev week (2001) | Diff from prev week (2002) | Diff from Prev Week (2003) | Diff from prev week (2004) | Diff from prev week (2005) | Diff from prev week (2006) | 4 year seasonal average | 5 year seasonal Average | 6 year seasonal average |
|------|------|------|------|------|------|------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|-------------------------|-------------------------|-------------------------|
| | 2001 | 2002 | 2003 | 2004 | 2005 | 2006 | | | | | | | | | |
| 1 | | 633 | 844 | 885 | 1017 | 1199 | | 0.942 | 0.945 | 1.000 | 0.901 | 0.850 | 0.962 | 0.947 | 0.93 |
| 2 | | 705 | 866 | 940 | 1044 | 1177 | | 1.114 | 1.027 | 1.062 | 1.027 | 0.982 | 1.070 | 1.058 | 1.04 |
| 3 | | 722 | 876 | 848 | 986 | 1192 | | 1.024 | 1.011 | 0.902 | 0.944 | 1.013 | 0.979 | 0.970 | 0.98 |

| 5 | 1732 | 1797 | -3.58 |
| 6 | 1674 | 1735 | -3.55 |

Just in Time Capacity Planning

- Definition of an Accurate Forecast
 - An accurate forecast is one that allows decisions to be made on when to purchase computing resources at the right time without impacting service level commitments.
 - A standard of variability of +/- 10% to the forecast
- Noise in a Forecast
 - Can a measure be used to determine noise in the forecast?

Just in Time Capacity Planning

- Observations
 - Business rate of growth doesn't vary much on a year to year basis
 - What changes are the periods of more or less activity
 - Individual workload impacts not considered in forecast
 - CICS, DB2, TSO
 - Adjustable for new work added to a system

Just in Time Capacity Planning

- One Problem
 - NOISE
 - How to identify in a short period of time whether or not the trend is NOISE or does some action have to be taken
 - What method can be used to determine if the variation from the forecast is noise or a call to action

Just in Time Capacity Planning

Just in Time Capacity Planning

Just in Time Capacity Planning

Just in Time Capacity Planning

- How to take the forecast to the next level
- Identification of Noise
 - What is noise?

Just in Time Capacity Planning

- Process Behavior Analysis
 - Statistical Control Analysis (STC) pioneered by Walter Shewhart at Bell Laboratories in the 1920's.
 - Assignable-cause and Chance-cause variation
 - Introduced control charts to distinguish between the two

Just in Time Capacity Planning

- Dr. Donald J Wheeler defined this process of control as:
“A phenomenon will be said to be controlled when, through the use of past experience, we can predict, at least within limits, how the phenomenon will vary in the future.”

And further refined Shewhart’s work:

“A process will be said to be predictable when, through the use of past experience, we can describe at least within limits, how the process will behave in the future.”

Just in Time Capacity Planning

- Upper and Lower Natural Process Limits
 - UNPL and LNPL
 - Can be calculated by multiplying the Average Moving Range by 2.66
- Results
 - A Capacity Forecast at a weekly view that accounts for the normal variance range. As long as the actual is within the bounds, the result is within the normal limits, can be considered “NOISE” and no action would be needed.

Just in Time Capacity Planning

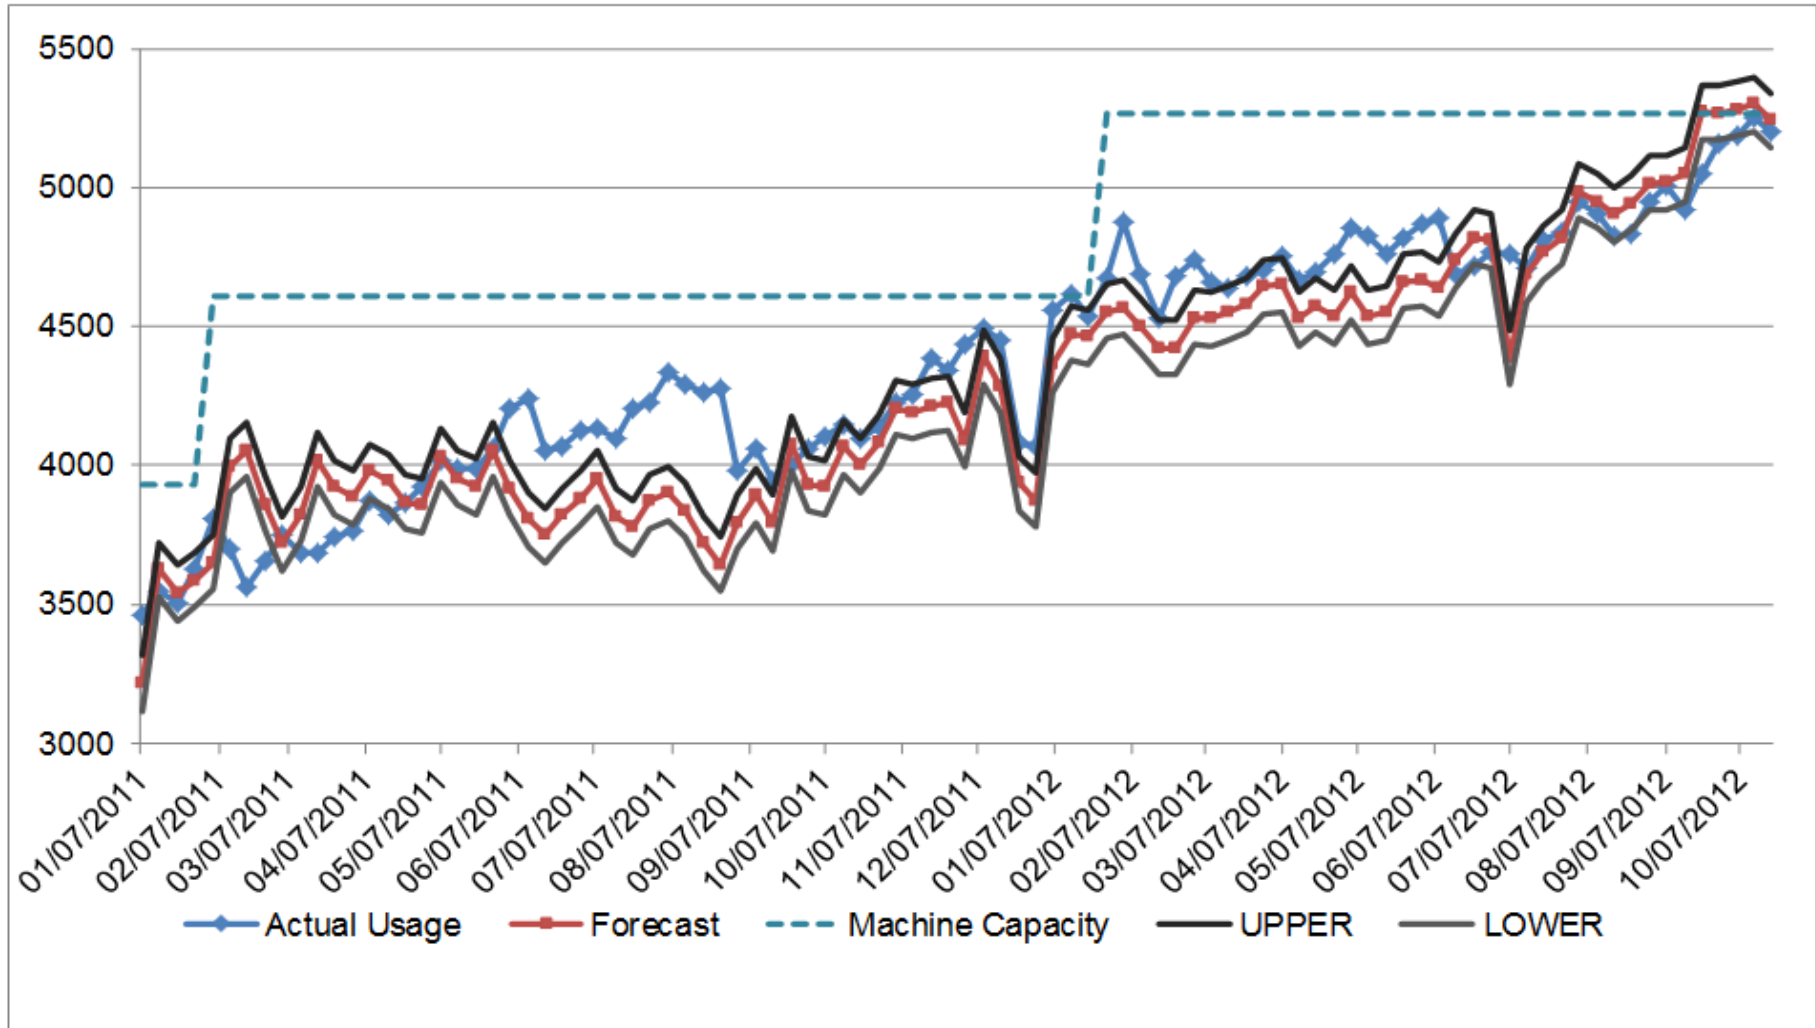

- Examples
 - The examples will show how the implementation has aided in identifying when additional capacity is needed
 - Transcends platforms
 - Transcends the traditional view of MIPS
 - Can use other measures as long as they are repeatable and are a representation of the work that is executed on the system

Just in Time Capacity Planning

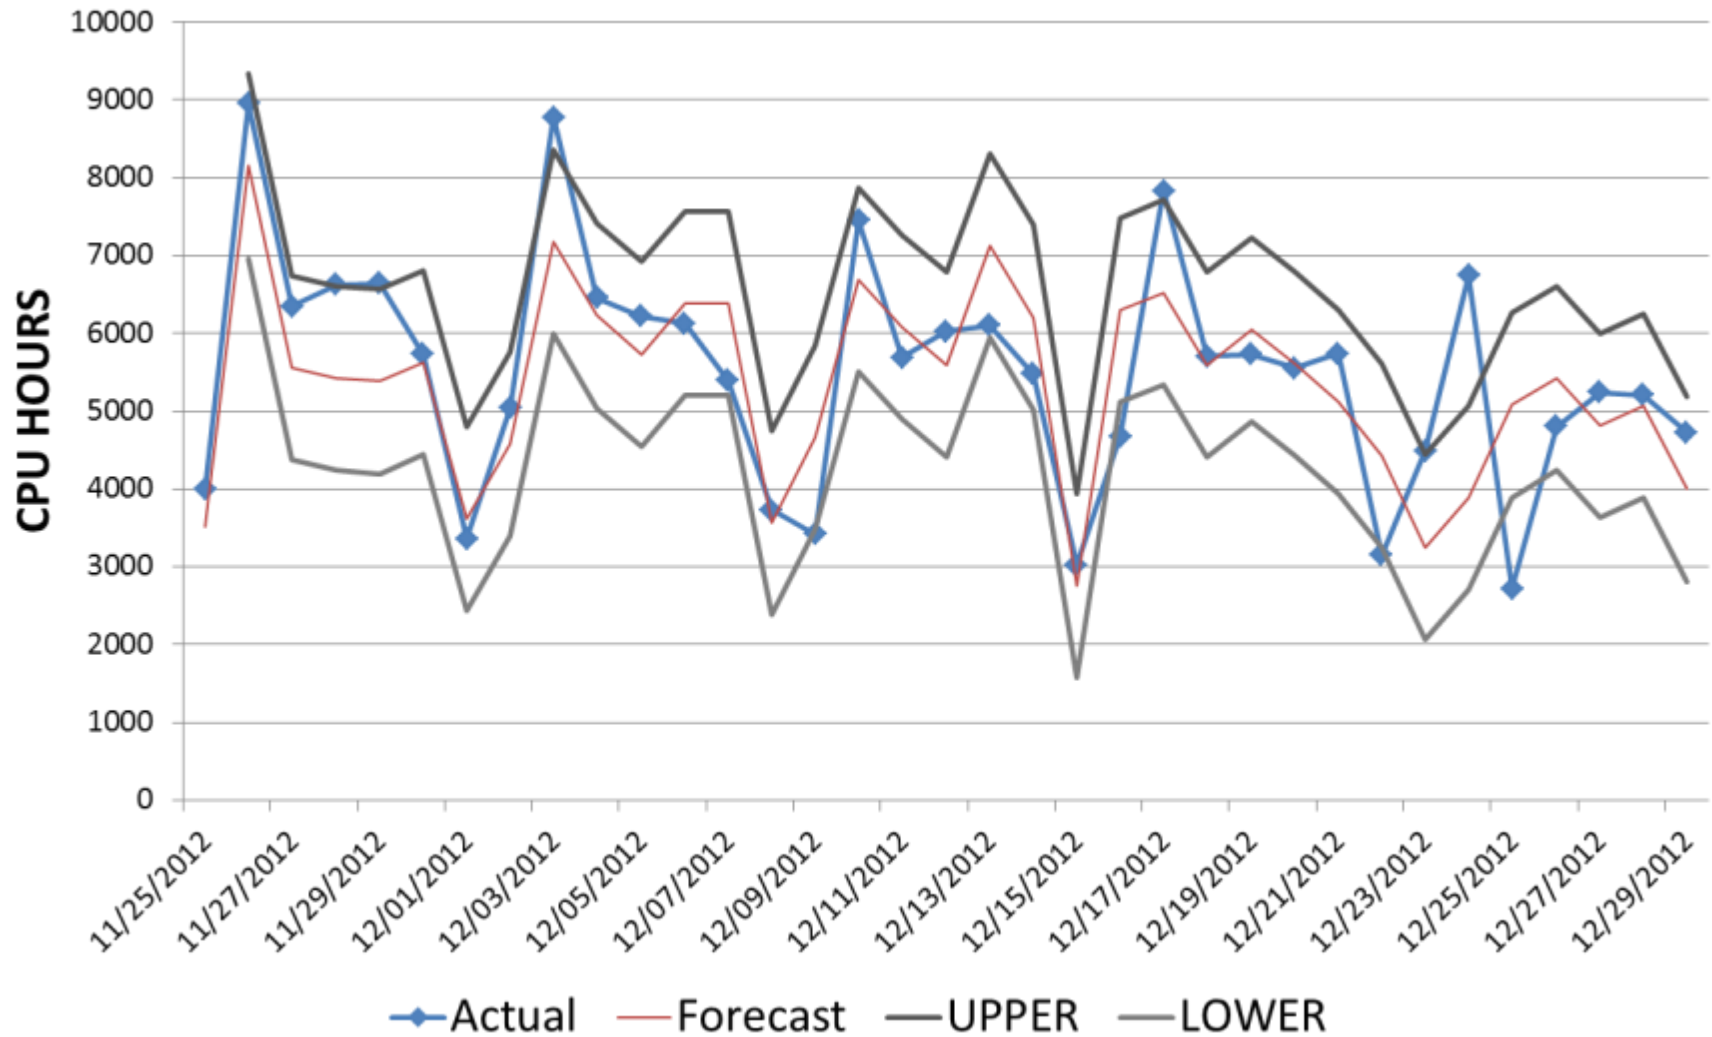

Just in Time Capacity Planning

Specialty Engines

Just In Time Capacity Planning

- Results
 - A new capacity chart is created showing peaks and valleys
 - The forecast is bound with process limits which accurately identifies Noise
 - Yearly / Seasonal patterns are more discernable
 - Documents the seasonal nature of businesses
 - Seasonal/Holiday Peaks easier to identify
 - Defer or anticipate CPU needs with a high degree of confidence
 - Accuracy of forecast builds credibility
 - Forecasts reliability for longer periods of time
 - Forecasts are good for 12-18 months out
 - Proven track record for twelve years with the methodology
