## Notes:

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

IBM hardware products are manufactured from new parts, or new and serviceable used parts. Regardless, our warranty terms apply.

All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved.

Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.

This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.

All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

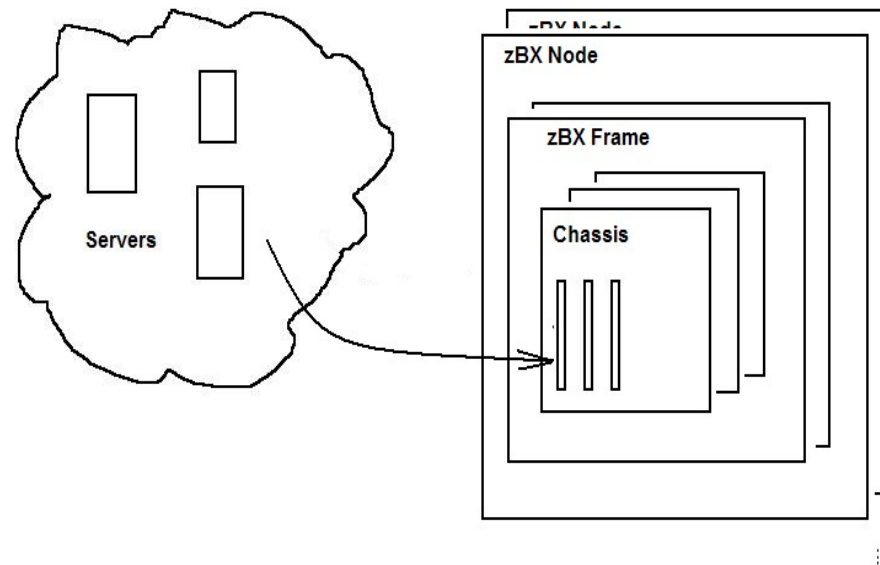

Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.

# Agenda

- Intro
- IBM zBladeSizer and IBM zBladeEXTR
- What problem is being solved
  - How are we solving it
  - Input data and customer controls
  - Optimization
- Documented results
- Demo
  
- Q+A

# The Problem: Server Migration to the zBX

- Find an optimum solution to a zBX server migration scenario
- Document the solution with a comprehensive set of reports and graphs
- Rapidly investigate alternative scenarios

# zBX Hardware Overview

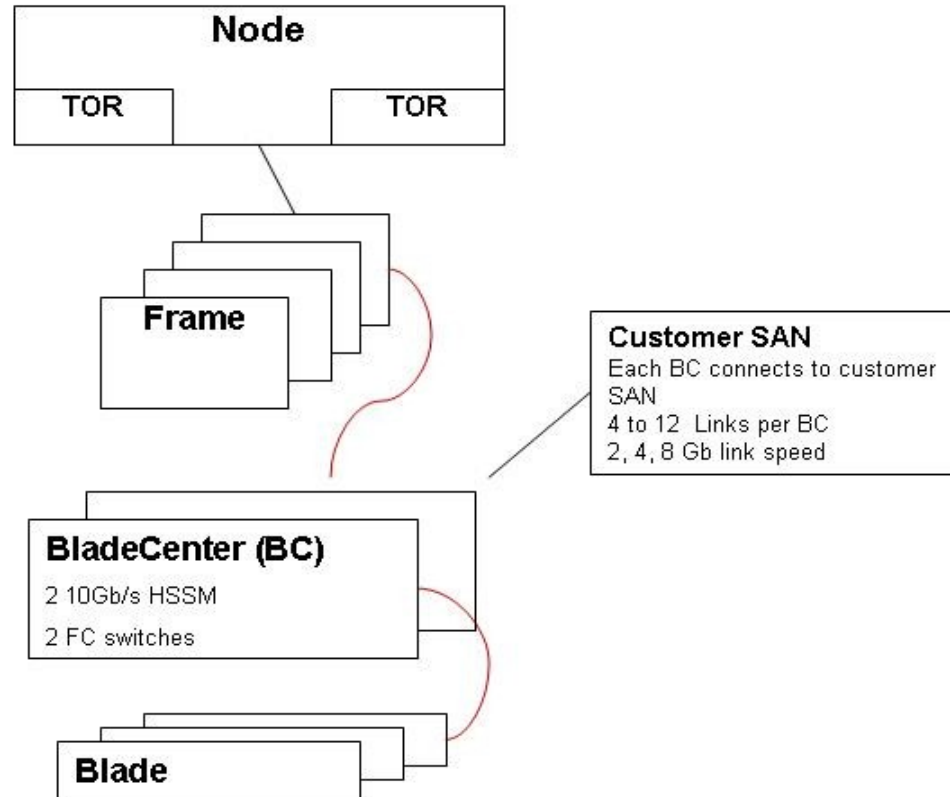

1 to 8 nodes per Ensemble

2 TORs per Node

1 to 4 frames per node

1 to 2 BC per frame

1 to 14 blades per BC

**Customer SAN**  
 Each BC connects to customer SAN  
 4 to 12 Links per BC  
 2, 4, 8 Gb link speed

**BladeCenter (BC)**  
 2 10Gb/s HSSM  
 2 FC switches

**Blade**

**Node**  
 TOR TOR

**Frame**

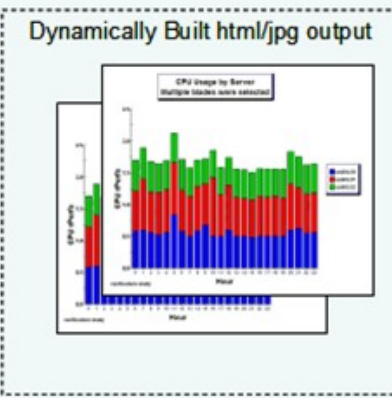

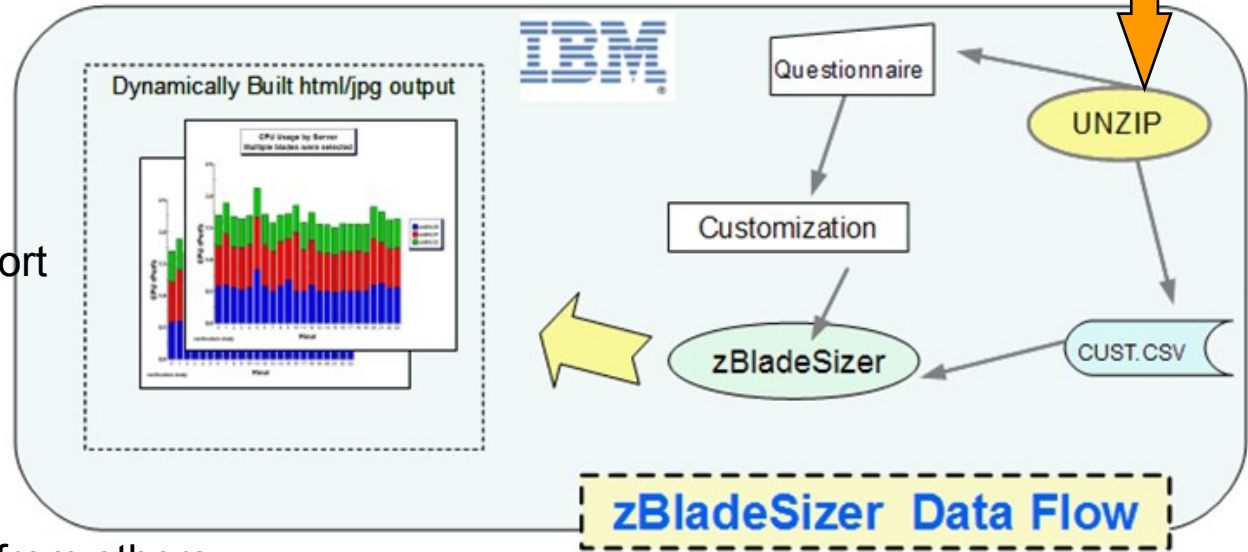

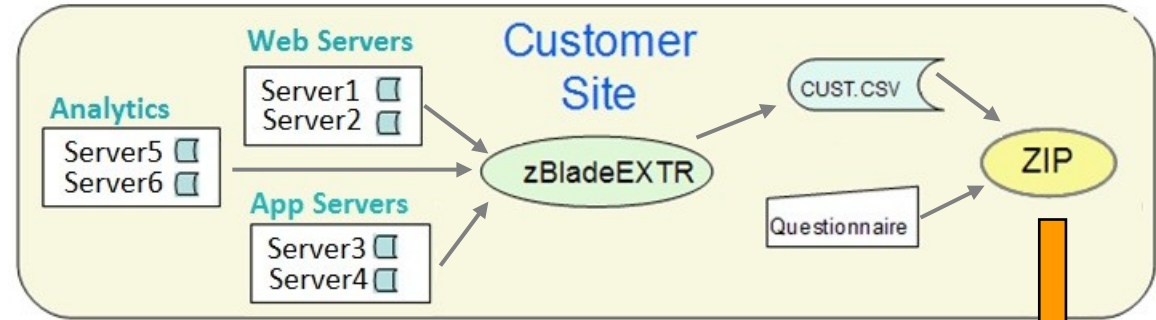

Systems configuration and performance data collected by zBladeEXTR (Power or x86)

Techline receives data and uses zBladeSizer to build a right-sized zBX configuration.

**Benefits:**

- Rapidly generated solution
- Easy generation of a solution report
- Interactive and easy to use
- Tailorable solution parameters:
  - zBX hardware parameters
  - Segregation of groups of servers by application
  - Isolation of specific servers from others
- Resource demands mapped to a 24 hour profile configure an optimum zBX solution, not just peak hour.
- A solution based on actual performance data including CPU, network and disk I/O, and memory

**zBladeSizer Data Flow**

# IBM zBladeEXTR

- Extract intervals from collected performance data
  - Customer can run zBladeEXTR and send file to IBM - OR -
  - Zip and ship data \* to IBM to run
- Validity checking
- Output a CSV and error/summary reports
- Prompted to fill out a questionnaire of customer business controls
- Help for data collection:
  - data collection guide
  - zBladeEXTR process wizard
  - Support from the IBM ATS organization

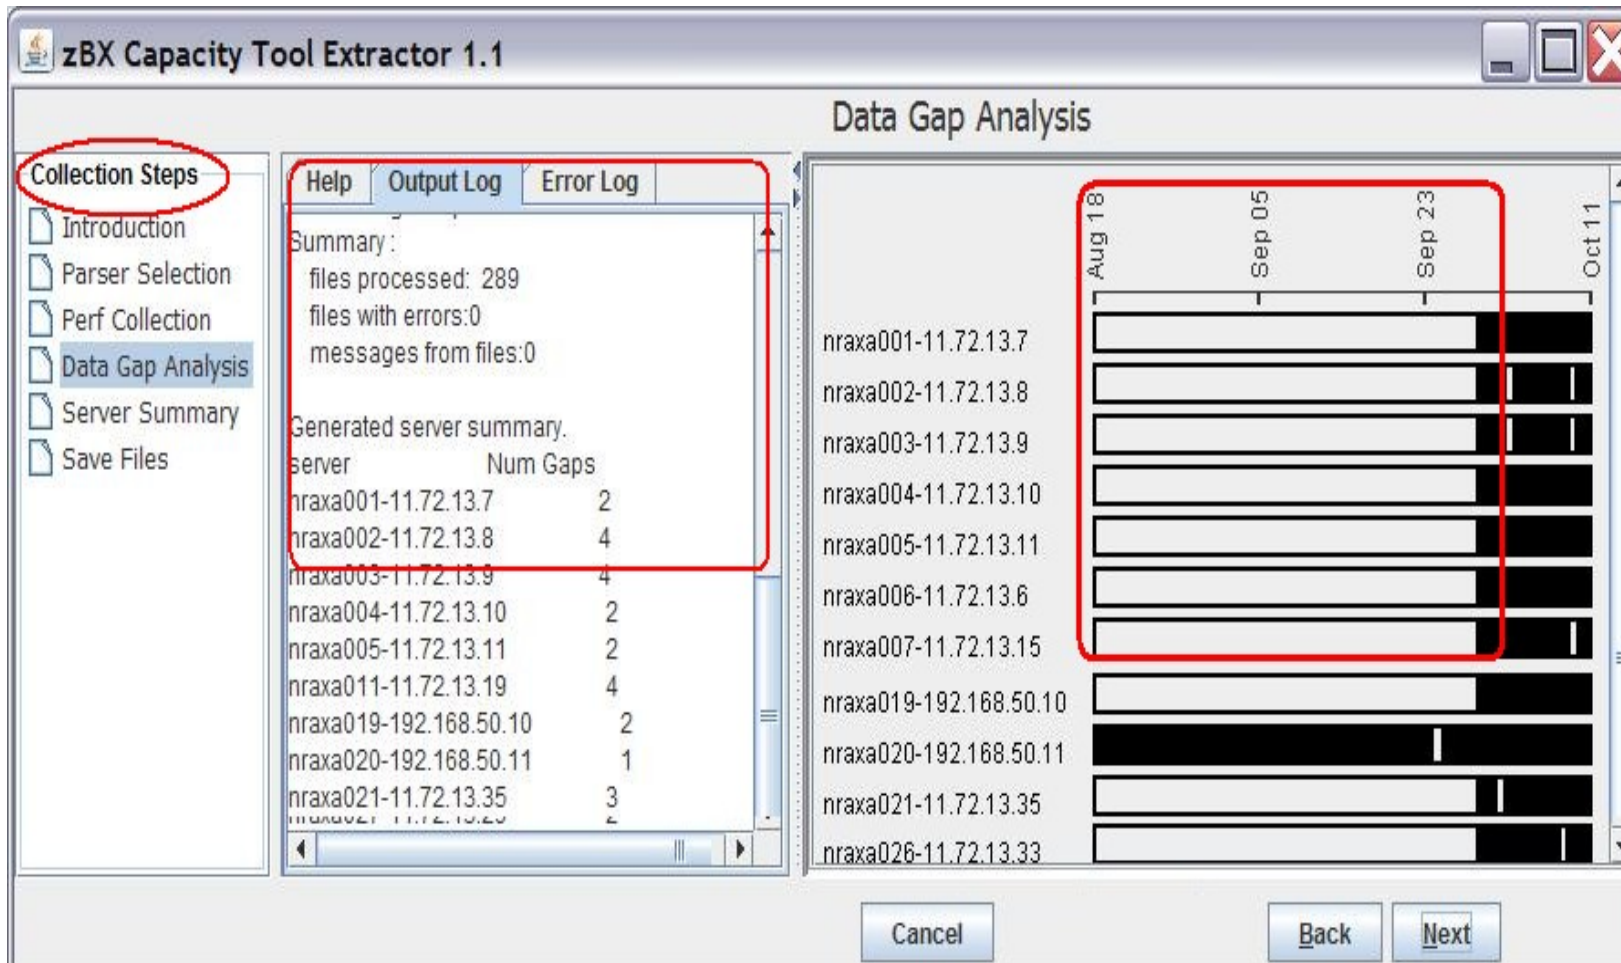

\* Performance Data Source:

- NMON data for System P
- SAR for System X server LINUX systems

# zBladeEXTR Data Gap Analysis

Is this the right set of data for analysis?

- Navigation
- Current status
- Step Detail

**zBX Capacity Tool Extractor 1.1**

### Data Gap Analysis

Collection Steps (circled in red):

- Introduction
- Parser Selection
- Perf Collection
- Data Gap Analysis**
- Server Summary
- Save Files

Summary:

- files processed: 289
- files with errors: 0
- messages from files: 0

Generated server summary.

server	Num Gaps
nraxa001-11.72.13.7	2
nraxa002-11.72.13.8	4
nraxa003-11.72.13.9	4
nraxa004-11.72.13.10	2
nraxa005-11.72.13.11	2
nraxa011-11.72.13.19	4
nraxa019-192.168.50.10	2
nraxa020-192.168.50.11	1
nraxa021-11.72.13.35	3
nraxa026-11.72.13.33	2

Bar Chart (red box highlights Aug 18 to Sep 23):

Server	Aug 18	Sep 05	Sep 23	Oct 11

# zBladeEXTR Questionnaire

## Application Server Groups

Groups are used to demark business functions and priorities

Servers are assigned to a group, and each group of servers can:

- Share blades
- Have different peak hours (or default)
- Have different CPU and memory usage constraint values (for warn and limit).
- Have different growth rates
- Order their placement on zBX blades.

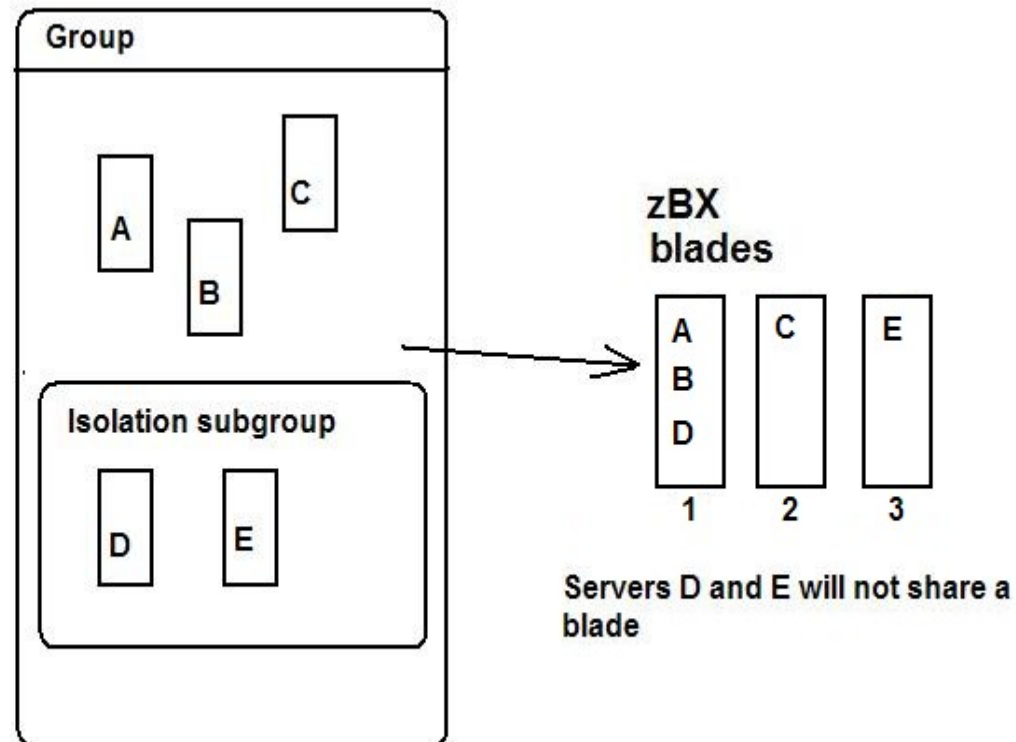

# zBladeEXTR Questionnaire

## Isolation Subgroups

Isolation subgroups separate servers

- Define isolation subgroups within a group
- Servers in an isolation subgroup will NOT share a blade

Servers D and E will not share a blade

# zBladeEXTR Questionnaire Hardware

- Blade selection
  - PS701 32,64,128GB
  - E7-2830  
64,128,192,256GB
- Number of reserved blades per chassis
- I/O paths (number of links and link speeds)
- I/O path usage constraints for each of the 5x2 connections (10 total because the links are full duplex)

Hardware Definitions
✕

Frames per zBX

Chassis per Frame

Blade Slots per chassis

Reserved blades per chassis

Virtual servers per blade

Blade type used for P

Blade type used for X

Is this minimum or fixed?

Minimum blade size

Fixed blade size

Disk (Fibre Channel)	Gb/s FD	# Links	Warn %	Limit %	Calc'd TPUT
Blade to Chassis FC switch	<input type="text" value="4.0"/>	<input type="text" value="2"/>	<input type="text" value="60"/>	<input type="text" value="70"/>	<input type="text" value="5.600"/>
Chassis FC switch to SAN	<input type="text" value="2.0"/>	<input type="text" value="4"/>	<input type="text" value="60"/>	<input type="text" value="70"/>	<input type="text" value="5.600"/>

Blade to Chassis HSSM	<input type="text" value="10."/>	<input type="text" value="1"/>	<input type="text" value="60"/>	<input type="text" value="70"/>	<input type="text" value="7.000"/>
Chassis HSSM to TOR	<input type="text" value="10."/>	<input type="text" value="1"/>	<input type="text" value="60"/>	<input type="text" value="70"/>	<input type="text" value="7.000"/>
TOR to Network	<input type="text" value="480.0"/>	<input type="text" value="1"/>	<input type="text" value="60"/>	<input type="text" value="70"/>	<input type="text" value="336.000"/>

# zBladeEXTR Questionnaire Capacity Planning Considerations

## Specification

- Growth Rate

## Customize It

By Group or Server

- Peak Hour Selection

Selected or Calculated

- Solution Constraints

Maximum allowable  
CPU and Memory %  
by group, and disk and  
network IO bandwidth  
% by configuration

# zBladeSizer: How it Solves the Server Migration Problem

- Data from server collection agents
- 24 hour statistical profiles each server, each resource
- Customer business controls
- Search for optimum solution
- Output best configuration
  - graphs and analysis
  - deliver report to customer

# Optimization in zBladeSizer

- Resource supplies from hardware definitions and usage constraints
- Resource demands from server usage data (and growth rates)
- Supply and demand are matched to find the configuration with the least number of blades
- The hybrid algorithm runs in parallel by solving each application server group independently, then combines the group results into a final configuration
  - For small sized groups, uses an exhaustive search
  - For larger groups, uses a genetic algorithm
  - Heuristics employed to reduce turnaround time

# Outputs from zBladeSizer

- Graphs and reports showing usage for 6 resources:
  - CPU
  - Memory
  - disk read and write IO
  - network read and write IO
- Shown by relevant hardware component,
  - Blade, chassis (blade center), frame, node
- Shown by group and server
- Reports show the layout of the zBX with server to blade assignments
- Reports can be saved to disk as HTML for import into a word processor

# Server to Blade Assignments

- Sample main view of the application showing server to group assignments and blade assignments

CHOOSE SEARCH OPTION TO FIND SERVER TO BLADE MAPPING SOLUTION AT BASELINE (8 BLADES)

Validate Generate Custom Reset

USE RIGHT CLICK TO ASSIGN SERVERS TO GROUPS

Servers:

Row	Server	IP addr	Group	Blade	Mess
1	LAPP01	2.3.4.183	DEFAULT	Node1.B.1.04	
2	LDB01	1.2.3.103	DATABASE	Node1.B.1.05	
3	MBS01	3.4.5.14	DEFAULT	Node1.B.1.04	
4	MBS02	3.4.5.15	DEFAULT	Node1.B.1.04	
5	WAS01	3.4.5.17	WAS : hot backup	Node1.B.1.02	
6	WAS02	3.4.5.18	WAS : hot backup	Node1.B.1.01	
7	WMDBS01	1.2.3.14	DATABASE	Node1.B.1.06	
8	WMWAS01	2.3.4.49	WAS	Node1.B.1.01	

# Servers on Blades

- Sample report output showing server assignment to blades, by blade. Also has isolation subgroup “hot backup”

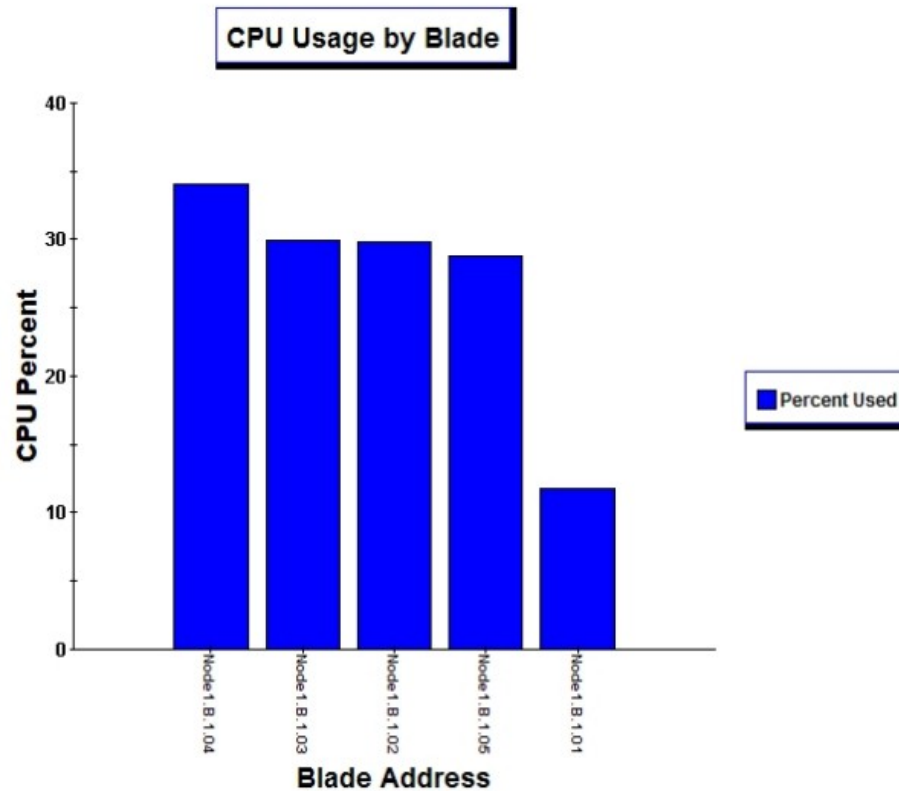

Node	Chassis	Blade Number	Blade Model	Sizing Group	Isolation SubGroup	Virtual Server	Server IP address	Peak Hour rPerfs	Max Memory (GB)	Net Bandwidth (Mbps)
Node1	B.1	01	PS701	WAS		WMWAS01	2.3.4.49	1.04	8	
			PS701	WAS	hot backup	WAS02	3.4.5.18	0.17	4	
		02	PS701	WAS	hot backup	WAS01	3.4.5.17	0.46	4	
		03	PS701	DEFAULT		app1	5.6.7.63	9.20	4	
			PS701	DEFAULT		asprd	2.3.4.91	0.14	16	
			PS701	DEFAULT		rdb1prod	6.7.8.15	2.60	36	
		04	PS701	DEFAULT		app2	5.6.7.64	0.91	4	
			PS701	DEFAULT		1 APP01	2.3.4.193	0.03	8	

## 2 Sample Charts Following

- CPU Usage by blade
  - The highest average CPU usage is at 35%
  - the CPU is relatively lightly used and does not stress the capacity of the PS701
  - one blade is very low usage, and that was because of the way the groups were setup
  
- Memory usage by blade
  - Can see how the memory has significant resource demands and contributes to the sizing of the zBX
  - All blades are sized identically

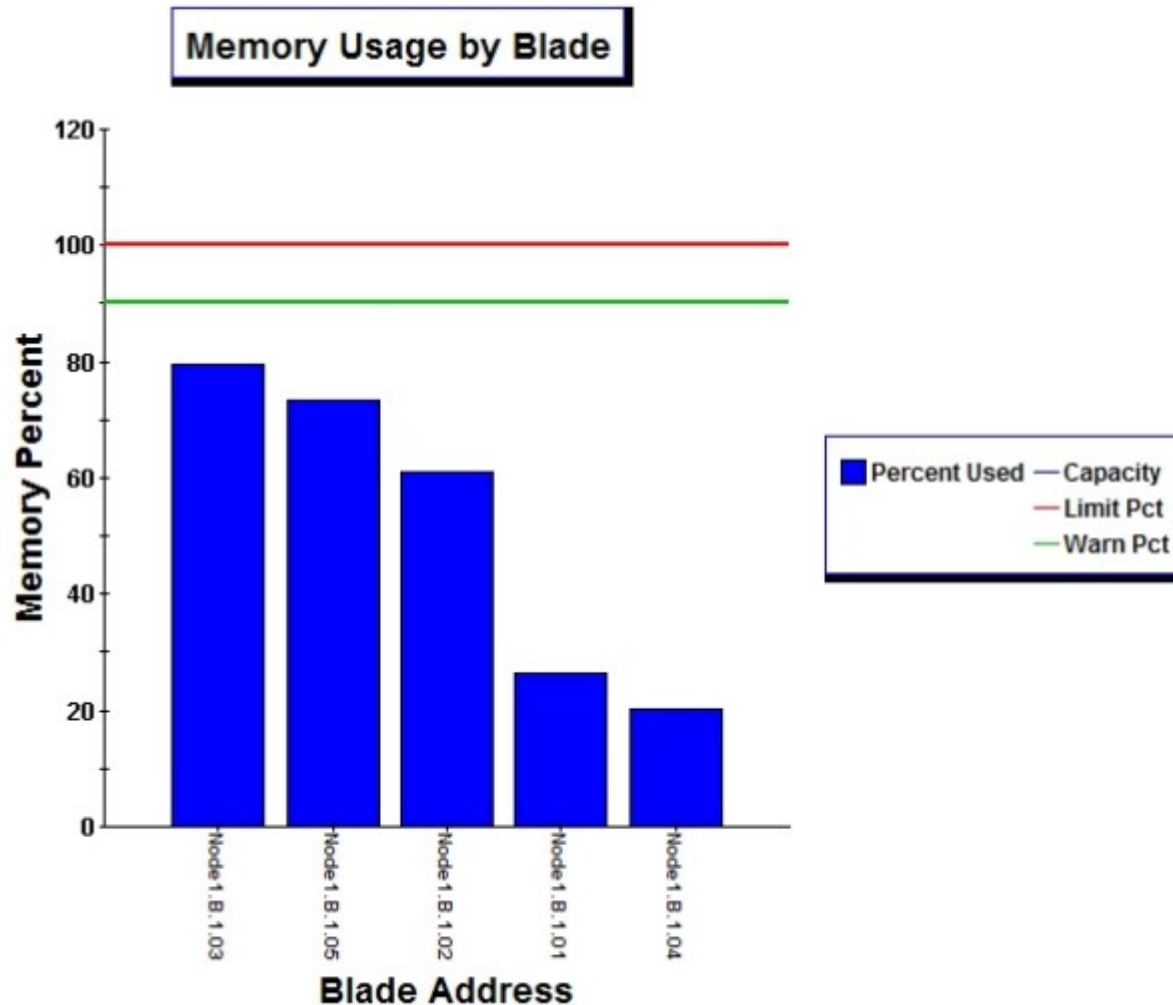

# Example: CPU Each Blade

Blade	CPU Percent Usage	Sizing Group	Peak Hour	Was peak selected or calculated?
Node1.B.1.04	34.09%	DATABASE	1	Calculated
Node1.B.1.03	29.90%	DEFAULT	1	Calculated
Node1.B.1.02	29.85%	DEFAULT	16	Calculated
Node1.B.1.05	28.77%	DATABASE	1	Calculated
Node1.B.1.01	11.74%	WAS	22	Calculated

# Example: Memory Each Blade

# X86 Server Platform Identification

- SAR data isn't as comprehensive as NMON, so we need to identify the source server platform
- Using vendor data which may change to a different vendor
- Previous decisions are retained for a rapid restart
- Filtering dialog to provide assist

**Identify All X86 Servers**

Each X86 server needs to have its source hardware platform identified. If zBladeSizer has processed this server, the "Hardware Description" will be populated with the last selection. If this server has not been processed before, the "Find Processor" button to launch the search dialog to identify what the source platform is. If you leave a Hardware Description empty, the server will be removed from the zBladeSizer input and the server will not be included in the study. If you cancel the process any of the input CSV file.

Server	Current Hardware Description	Press to Choose
server1 / 1.1.1.1	XEON,IBM,X7460,2.66,0.0,6,12,false	Find Processor
server2 / 2.2.2.2	XEON,IBM,L5420,2.5,0.0,4,4,false	Find Processor
server3 / 3.3.3.3	XEON,IBM,E7-4820,2.0,0.0,8,16,true,3950 X5	Find Processor
server4 / 4.4.4.4	CORE,IBM,i3-2120,3.3,0.0,2,2,false	Find Processor

# Selecting the X86 platform

- Display gathered info
- Each column has an automatic filter

**Identify X86 Server**

Server Properties: **server1 / 1.1.1.1**

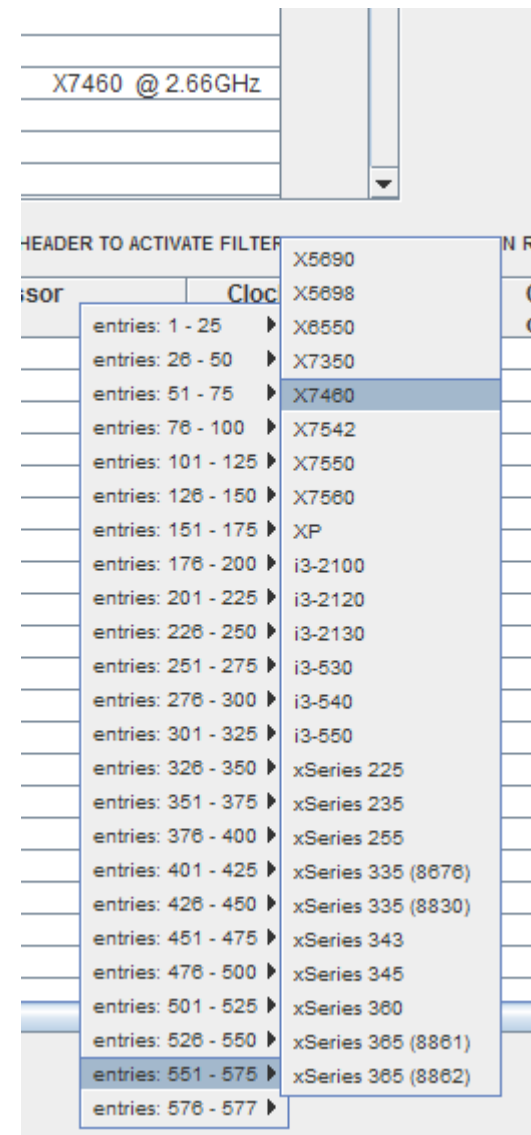

Property	Value
memorywasroundedup	true
cpuStepping	1
cpuMIPS	5330.67
vendor	GenuineIntel
serialnbr	VMware
name	server1
cpuModelName	Intel(R) Xeon(R) CPU X7460 @ 2.66GHz
modMask	0
lastdatetime	2012/02/15 00:00
memsize	3903

X86 Processor List: RIGHT CLICK ON COLUMN HEADER TO ACTIVATE FILTER MENU. RIGHT CLICK ON ROW FOR SINGLE ITEM

Processor Type	Vendor	Processor Model	Clock (GHz)	Cache (MB)	Cores on Chip	Num of C
ATHLON	DELL	4450B	2.3	0	2	
ATHLON	DELL	5600B	2.9	0	2

# zBladeSizer Addendum on Hybrid Optimization Algorithm

- Constrained optimization problem, a search through solution space
- Possible solution set and feasible solution set, unconstrained search
- Group segregation to make parallel
- Group solution is a server to blade assignment
- Fitness score is the number of blades for a group, tie breaker std dev of CPU
- Genetic algorithm (GA) vs. exhaustive search for small groups
- The GA population as a parallel solver
  - Ranking by fitness, cull by score
  - Breeding and selection, cross over, mutation
- 24 hour profile and the six resources, supply [\* constraints] and demand [\* growth rates]
- Configuration build is a combination of groups and the application of additional constraints
- Multiple independent runs to improve solution space coverage
