The following are trademarks or registered trademarks of other companies.

Adobe, the Adobe logo, PostScript, and the PostScript logo are either registered trademarks or trademarks of Adobe Systems Incorporated in the United States, and/or other countries.

Cell Broadband Engine is a trademark of Sony Computer Entertainment, Inc. in the United States, other countries, or both and is used under license there from.

Java and all Java-based trademarks are trademarks of Sun Microsystems, Inc. in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

Windows Server and the Windows logo are trademarks of the Microsoft group of countries.

InfiniBand is a trademark and service mark of the InfiniBand Trade Association.

Intel, Intel logo, Intel Inside, Intel Inside logo, Intel Centrino, Intel Centrino logo, Celeron, Intel Xeon, Intel SpeedStep, Itanium, and Pentium are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

ITIL is a registered trademark, and a registered community trademark of the Office of Government Commerce, and is registered in the U.S. Patent and Trademark Office.

IT Infrastructure Library is a registered trademark of the Central Computer and Telecommunications Agency, which is now part of the Office of Government Commerce.

* All other products may be trademarks or registered trademarks of their respective companies.

Notes:

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

IBM hardware products are manufactured from new parts, or new and serviceable used parts. Regardless, our warranty terms apply.

All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.

This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.

All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

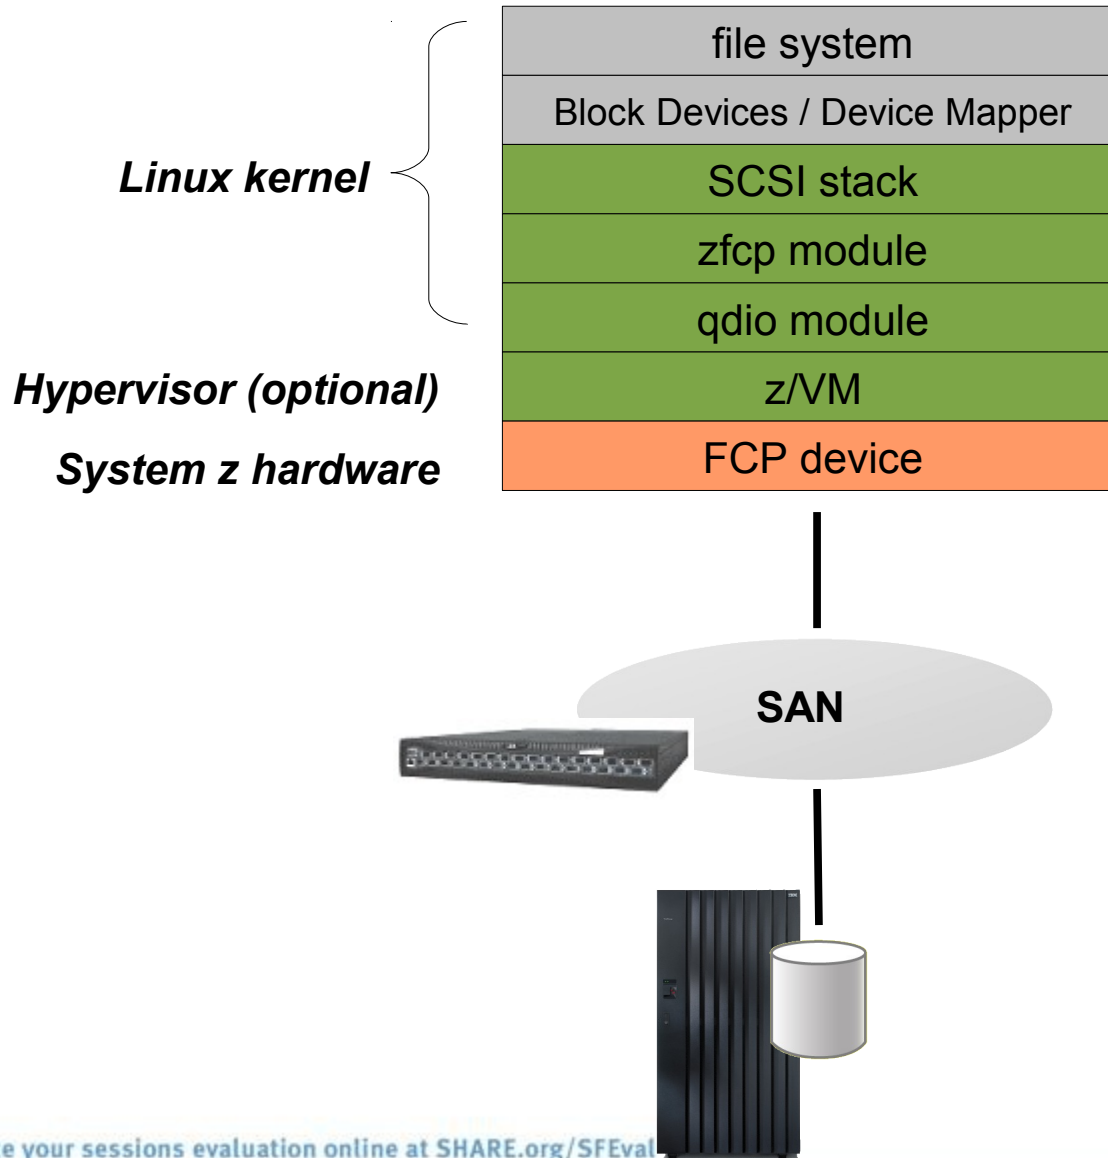

Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.

Agenda

- Purpose
- Workflow Overview
- Collecting Data
 - Data Sources
 - Architecture
 - ziomon Usage
- Analyzing Data
 - ziorep_config
 - ziorep_utilization
 - ziorep_traffic
- Hints & Tips
- Data Analysis on Other Platforms

How files end up on Storage Devices

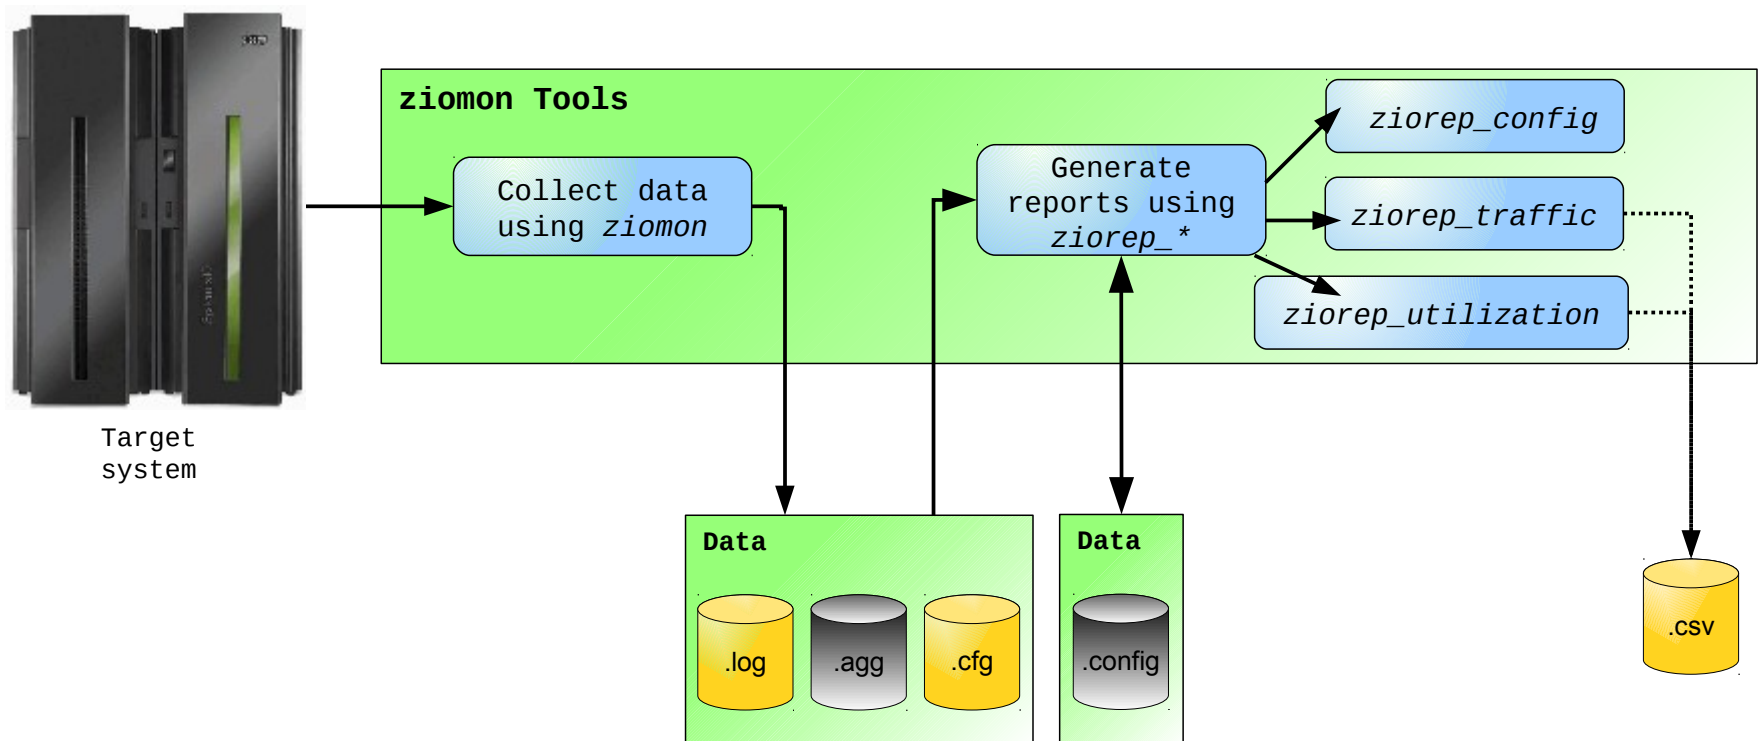

Motivation

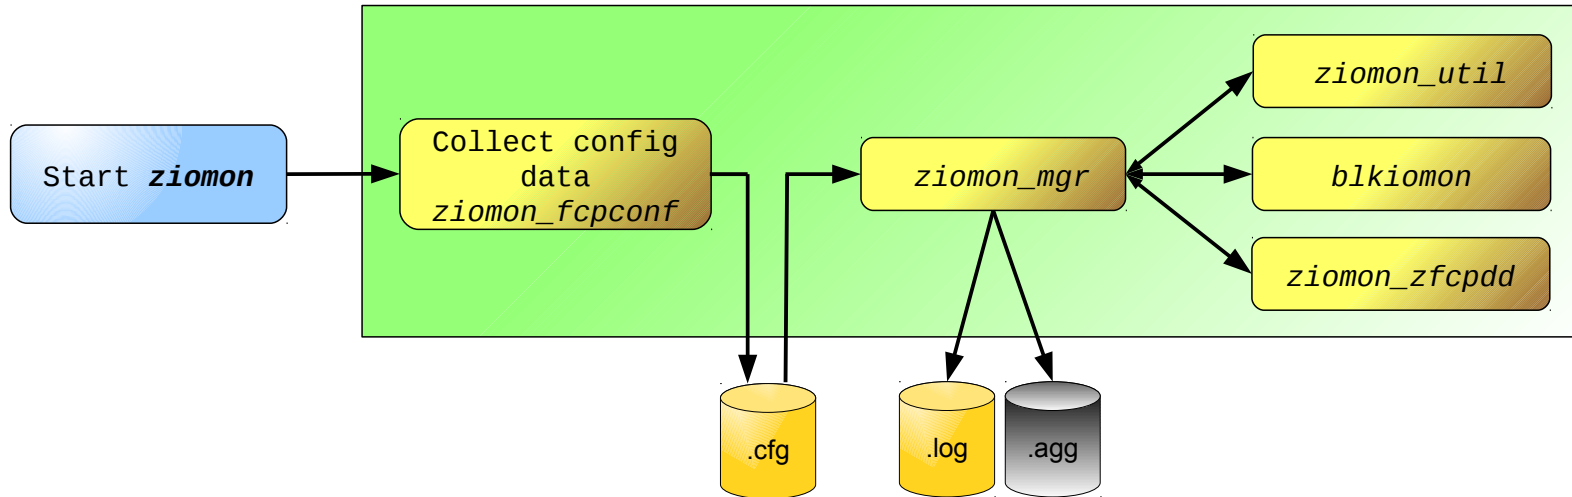

- Performance issues can potentially stem from multiple sources
- Focusing on a single component will not tell the whole story
- Holistic approach, considering all components involved (Linux, hypervisors, HBAs, SAN with storage devices) is required
- Requires advanced data analysis features, e.g. for filtering and aggregation
- *ziomon* tools aim at providing all of the above
- Availability:
 - SLES: Part of the *s390-tools* package starting with SLES10 SP3 and SLES11 SP1
 - RHEL: Part of the *s390utils* package starting with RHEL 5.4 and provided as *s390utils-ziomon* beginning with RHEL 6
- Dependencies: Requires the *blktrace* package as well as `CONFIG_BLK_DEV_IO_TRACE` enabled in the kernel config

Workflow Overview

- Collect data using *ziomon*
- Yield resulting files (.log, .agg & .cfg - all required)
- Use reporting tools to analyze data

Collecting Data: Components

- Components used by ziomon to collect data:
 - *ziomon_fcpconf* : zfcf configuration
 - *ziomon_zfcpdd*: Channel & fabric latencies, QDIO outbound queue utilization
 - *ziomon_util*: zfcf adapter utilization
 - *blkmon*: blktrace component for SCSI subsystem latencies
- Note: Data collection only starts after the configuration has been captured

Collecting Data: Invocation

- Minimum invocation:

```
user@larsson:~> ziomon -d 5 -o data /dev/sda
```

- Mandatory parameters to use:

- d : total data collection duration in minutes
- o : output file – should be on a device not sampled by *ziomon*!
- <device> : SCSI device to monitor

- *ziomon* will aggregate data during collection, defaults to 60 seconds. I.e. it will not collect data on individual I/O operations.
- Use '-i' to specify an arbitrary interval length for aggregation. E.g. to invoke with highest possible resolution (2 seconds) use

```
user@larsson:~> ziomon -d 5 -i 2 -o data /dev/sda
```

- Use '-l' to specify size limit for .log file.

```
user@larsson:~> ziomon -d 5 -l 137M -o data /dev/sda
```

Will wrap around in case specified limit is too low (like in a ring buffer).
The overwritten data is aggregated into a single (bigger) interval in a .agg file.

Collecting Data: Specifying Devices

- Example:

```
user@larsson:~> multipath -ll
36005076303ffc562000000000000010cc dm-0 IBM,2107900
[size=5.0G][features=0][hwhandler=0]
\_ round-robin 0 [prio=2][active]
\_ 1:0:0:1087127568 sdb 8:16 [active][ready]
\_ 0:0:0:1087127568 sda 8:0 [active][ready]
```

- Multiple ways to specify devices for collecting data:

- Provide a list of single path devices:

```
user@larsson:~> ziomon [...] /dev/sda /dev/sdb
```

- Specifying multipath devices will identify all underlying devices (recommended):

```
user@larsson:~> ziomon [...] /dev/mapper/36005076303ff...
```

- Mixing single path and multipath devices is possible

```
user@larsson:~> ziomon [...] /dev/mapper/36005076303ff... \  
/dev/sdc /dev/sdd
```

Collecting Data: Specifying Devices (continued)

- Notes:

- SCSI tape devices are supported, too
- *blktrace* (as used by *ziomon*) requires 2MB vmalloc memory per device *and* processor
- Check current configuration:

```
user@larsson:~> grep Vmalloc /proc/meminfo
```

- Use kernel parameter vmalloc to increase, e.g. `vmalloc=512M`

Data Analysis

- Use the *ziorep_** commands to generate reports and investigate data:
 - *ziorep_config*: Insight into the zfcf configuration
 - *ziorep_utilization*: Adapter utilization statistics
 - *ziorep_traffic*: Traffic statistics
- Note: Always pass on all files (.log and .cfg, and possibly .agg) when forwarding data to others for analysis

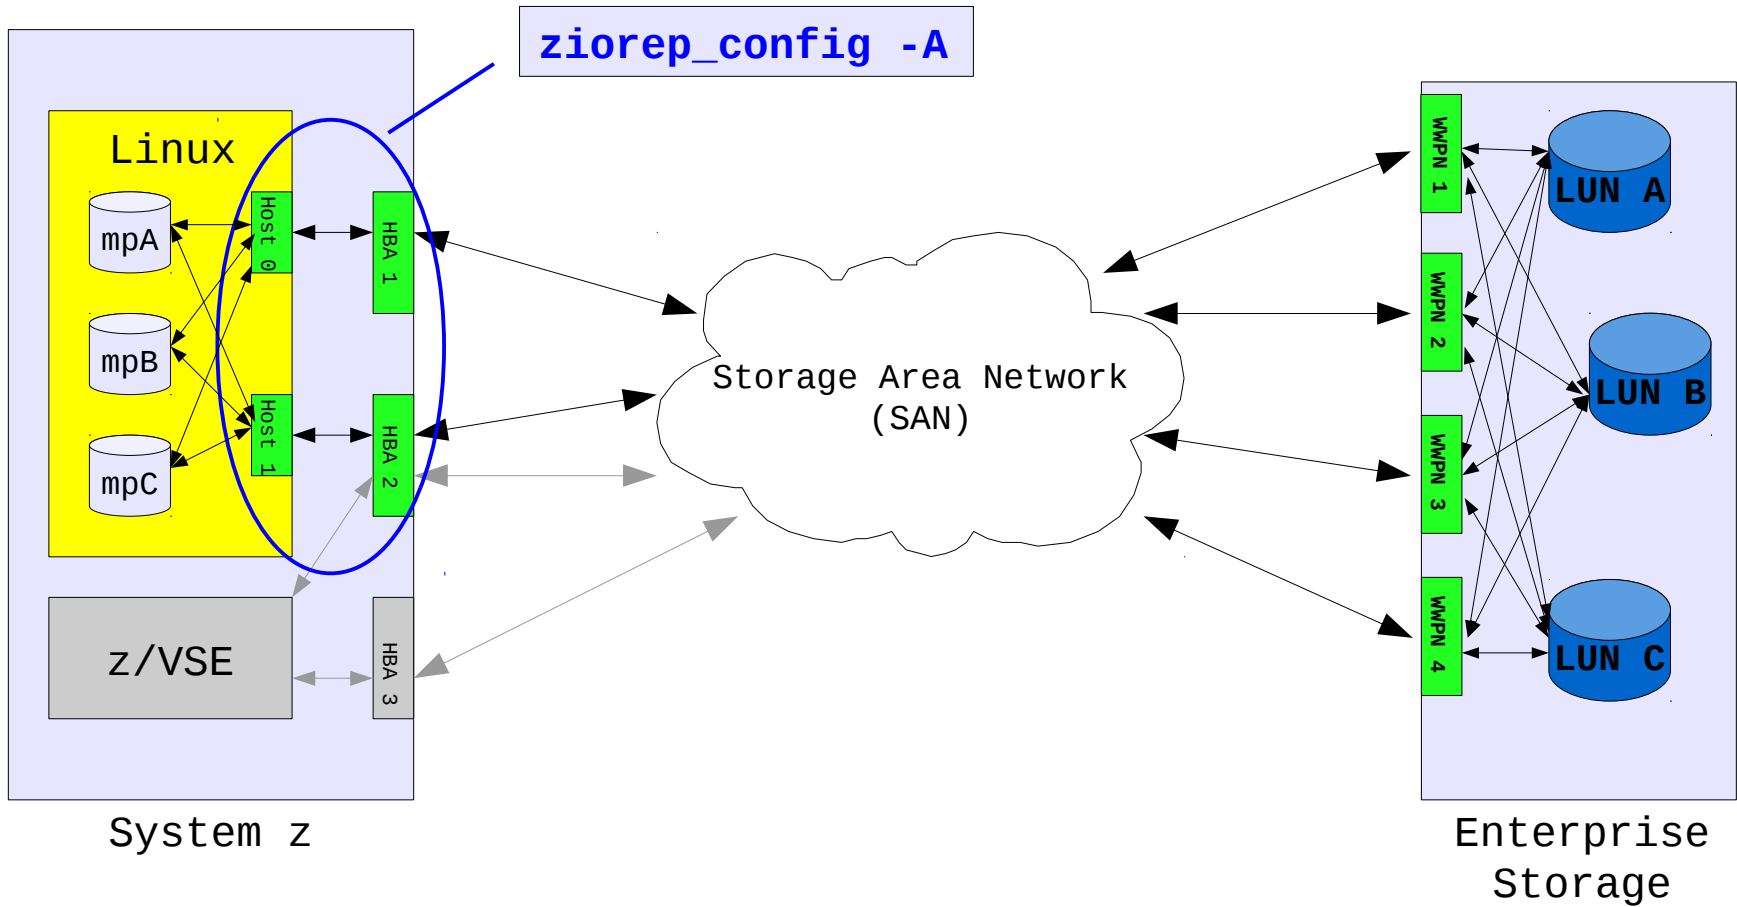

Data Analysis: Configuration Report Overview

- `ziorep_config` can take a `.cfg` file as input

```
user@larsson:~> ziorep_config -i sample.cfg
```

- Displays information on zfcplib-related hardware (HBAs, single and multipath devices) data was collected on.
- Skip the `'-i'` parameter for a report on the current system.
- 3 different report types available:
 - Adapter report (**default**, option `'-A'`): HBA details
 - Multipath report (option `'-M'`): Multipath/device mapper details
 - Devices report (option `'-D'`): SCSI device details
- Selection options to limit output to a subset only (can be combined):
 - `'-p <port>'` limits output to specified WWPN, e.g. `'-p 0x5005123456789000'`
 - `'-l <lun>'` limits output to specified LUN, e.g. `'-l 0x401040a600000000'`
 - `'-m <mdev>'` limits output to specified multipath device, e.g. `'-m 36005076303ffc56200000000000000010a6'`
 - `'-a <adapter>'` limits output to specified adapter, e.g. `'-a 0.0.3c07'`
 - `'-s <scsi_host>'` limits output to specified SCSI host, e.g. `'-s host0'`
 - `'-d <device>'` limits output to specified device, e.g. `'-d sde'`

Data Analysis: Adapter Configuration Report

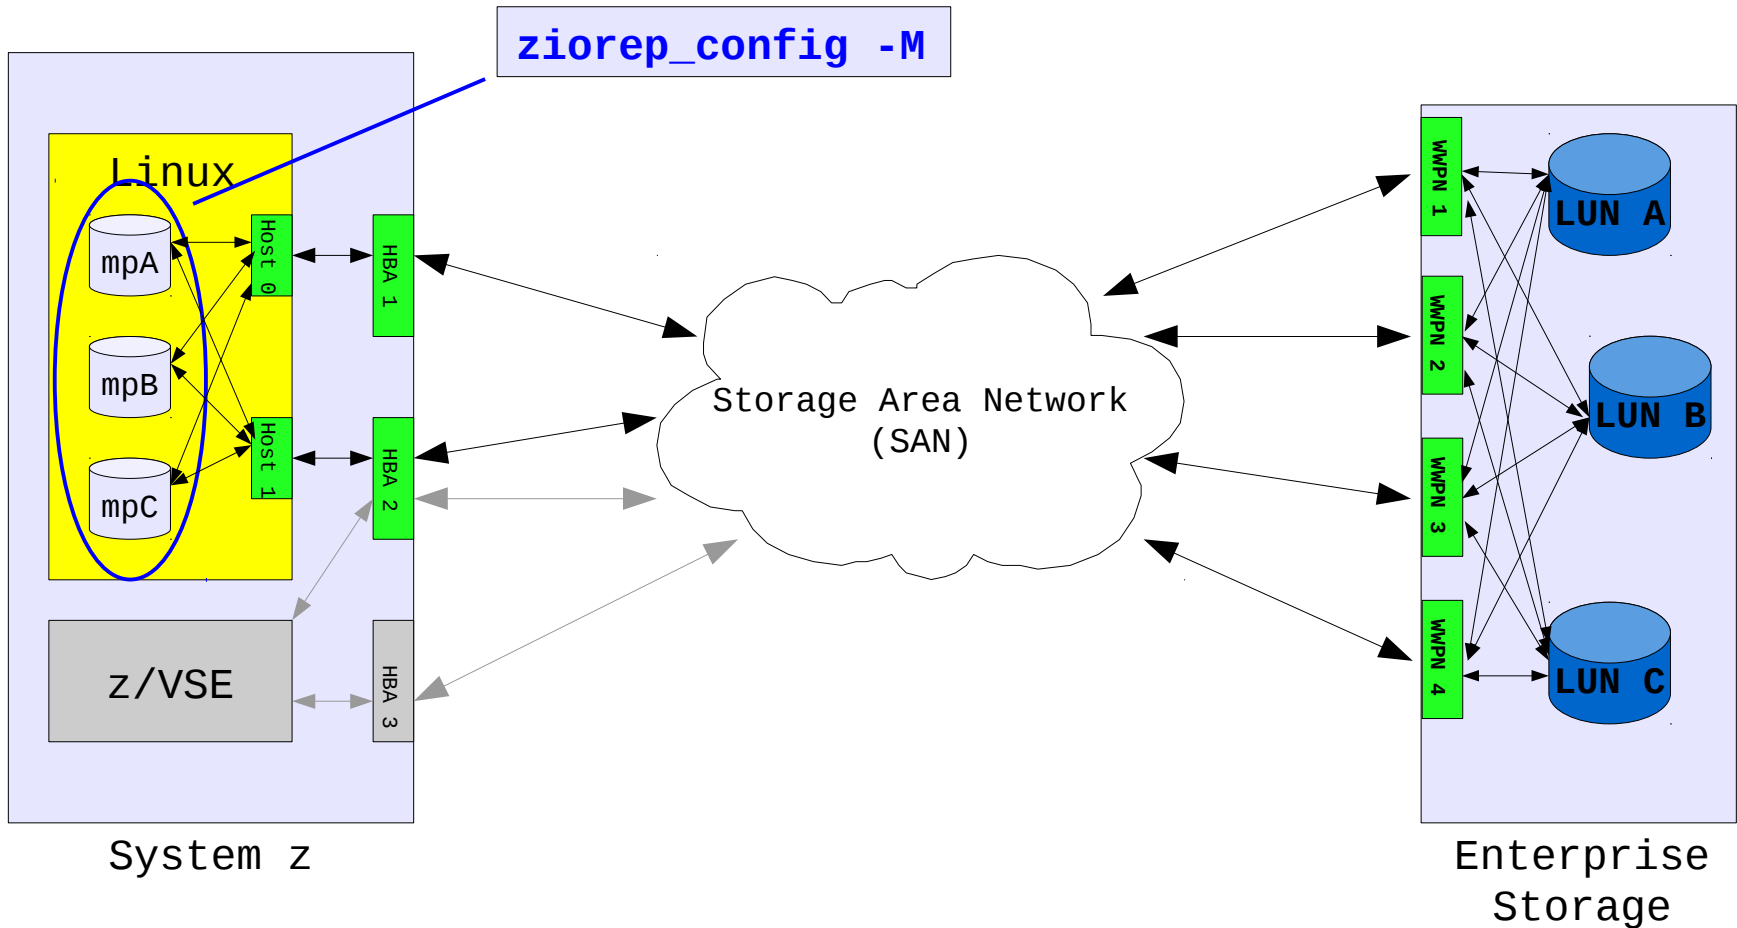

Data Analysis: Adapter Configuration Report (continued)

```
user@larsson:~> ziorep_config -A -i sample.cfg \

Data Analysis: Adapter Utilization Report

- Ficon Express card with FCP CHPIDs has a CPU, bus and adapter chip
- Utilization report provides two sections:
 - **FCP channel** report provides details on
 - CPU utilization
 - Bus utilization
 - Adapter utilization
 - **Virtual HBA** report provides details on
 - QDIO utilization, queue full and failure conditions
 - Throughput
 - I/O requests numbers
- Purpose: Identify potential bottlenecks within the adapter
- Note: Percentages reported are for entire FCP channel – no fraction according to utilization given when FCP channel is shared by multiple OS images!
I.e. high utilization during phases of inactivity point to activity on other OS images sharing the same channel.

Data Analysis: Adapter Utilization Report

- Use '-s' to get a quick overview of the available data

```

```

- Use '-b <begin>' and '-e <end>' to limit output to specified timeframe
- Use '-i <length>' to aggregate data to bigger intervals
- Use '-c <chpid>' to limit output to specified adapter
- Notes:
 - Check the interval length to figure out available aggregation values
 - Aggregated range only listed in case of wrap-around in .log file (.agg exists)

Traffic Analysis

Data Analysis: Traffic Report

- *ziorep_traffic* aims at identifying latencies of all components involved
- Provides two views on data
 - Regular view listing min/max/avg/std (default)
 - Detailed view providing histograms
- Supports option '-s' for a data summary (just like *ziorep_utilization*)
- Supports device selection options '-c/-u/-p/-l/-d/-m' (similar to *ziorep_config*)
- Provides data aggregation capabilities
- **Notes:**
 - Numbers reported consider *serialized* traffic! I.e. parallelism of requests is not accounted for. Hence throughputs are likely to divert from what other tools will report!
 - *ziomon* has a performance impact of approx. 5 percent on CPU utilization

Data Analysis: Traffic Report - Default View

```

Data Analysis: Traffic Aggregation

- Use option '-C' to specify an aggregation level:
 - 'a'/'u' aggregates by CHPID / bus-ID
 - 'p' aggregates by WWPN
 - 'm' aggregates by multipath device
 - 'A' aggregates **all** data

- Can be combined with device selection options '- c/ - u/ - p/ - l/ - d/ - m'
- Note: Don't confuse *device selection* with *aggregation* options:
 - Device Selection:** restricts use of data records according to the scope specified (e.g. data records for specific LUNs only)
 - Aggregation:** generates combined results for given level of detail (e.g. combined result for all I/O handled by specified adapter)

➔ **Filtering** applies to *input* data, **aggregation** shapes the resulting *output*

Data Analysis: Traffic Aggregation Examples

- Aggregate by bus-ID

```

user@larsson:~> ziorep_traffic sample.log -i 60 -Cu

Data Analysis on Other Platforms

- Reporting tools do not depend on s390 architecture
- To compile on other platforms:
 - Extract source of *s390-tools* package, either from your distribution's source rpm, or download from <http://www.ibm.com/developerworks/linux/linux390/s390-tools.html> and extract via

```
user@larsson:~> tar xvfj s390-tools-1.17.0.tar.bz2
```

- Change to *ziomon* subdirectory, build and install

```
user@larsson:~> cd s390-tools-1.17.0
user@larsson:~> make
user@larsson:~> sudo make install
```

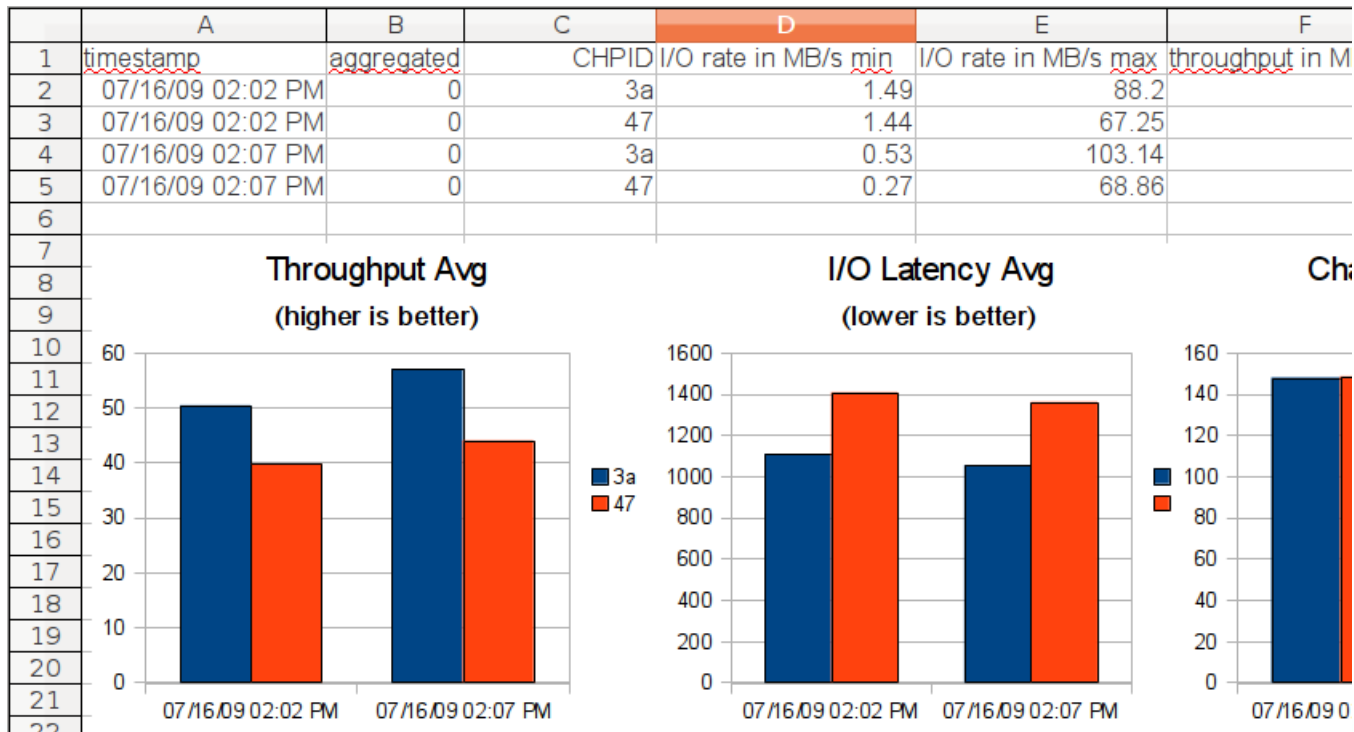

- Run reporting tools on any given data

Data Analysis on Other Platforms (continued)

- Use option '-x' in *ziorep_utilization* and *ziorep_traffic* to export data to .csv format, e.g.

```
user@larsson:~> ziorep_traffic data.log -x -i 300 -b "2012-11-27 08:45:21" -C a
```

- All data filtering options specified will apply to exported data
- Import in spreadsheet and perform further processing
