  - System

#### Category: System Preferences

Variables in this category have been prepopulated with values from the system registry for CA31.

If you click Save or Next, values set on this panel are saved and the system registry is updated.

Note: The system registry is a repository of variable data that is shared by all products managed by CA CSM, and changes that you make on this step update the content of the system registry. If a variable already has a value and you are configuring products that target shared systems, then any change you make will affect other users of these shared systems.
