Notes:

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions. This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area. All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Storage Class Memory (SCM)

- ◆ Overview
- ◆ Assigning flash memory to partitions
 - Where are allocations specified?
 - Can allocations be increased?
- ◆ Using SCM in z/OS
 - What is new in z/OS for SCM?
 - Can SCM be added / removed?
- ◆ Finding SCM information in RMF

What is Flash Express ?

New feature on the IBM zEnterprise EC12 and BC12

Designed to provide improved performance and availability

Internal storage implemented with Flash solid state drives

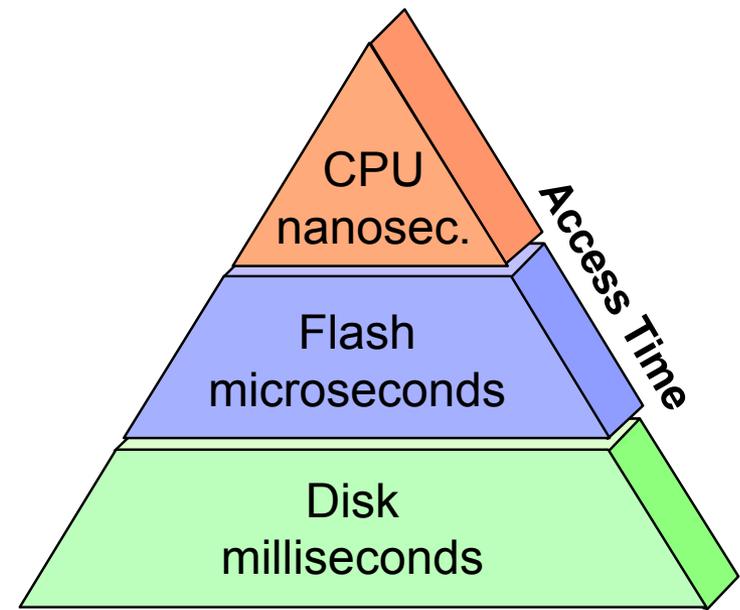

- ◆ Flash Express cards plug as pairs into the PCIe I/O drawers (PCIe = Peripheral Component Interconnect express)
- ◆ A pair of cards provides 1.4 TB of usable storage
- ◆ A maximum of 4 pairs are supported (4 pairs * 1.4 TB/pair = 5.6 TB)

A new tier of memory

Storage Class Memory (SCM)

Accessed using the Extended Asynchronous Data Mover (EADM)

- ◆ Optimized path for flash access
- ◆ Access initiated with Start Subchannel instruction

Flash Express Feature

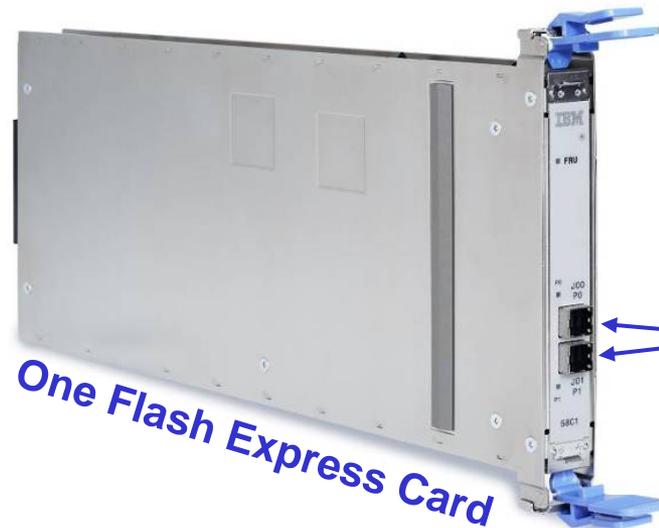

Flash cards are always installed in pairs

Each pair is installed in PCIe I/O drawer with one card per I/O domain

Pair is connected with interconnect cables

Card pair are a RAID 10 mirrored pair

- ◆ If one card fails, data is available on the other card
- ◆ Card replacement is concurrent

One Flash Express Card

Two ports to form a RAID 10 mirrored pair with the second Flash Card

Using Flash Express

Flash memory is assigned to logical partitions

- ◆ Each partition's Flash memory is isolated from other partitions
- ◆ Increment size is 16 GB

Assignment performed at the SE or HMC using the Flash Memory Allocation panel

- ◆ Assignment is by memory amount
- ◆ Specify initial and maximum amount to be available to a partition
- ◆ Additional Flash memory can be dynamically configured online to a logical partition

Manage Flash Allocation

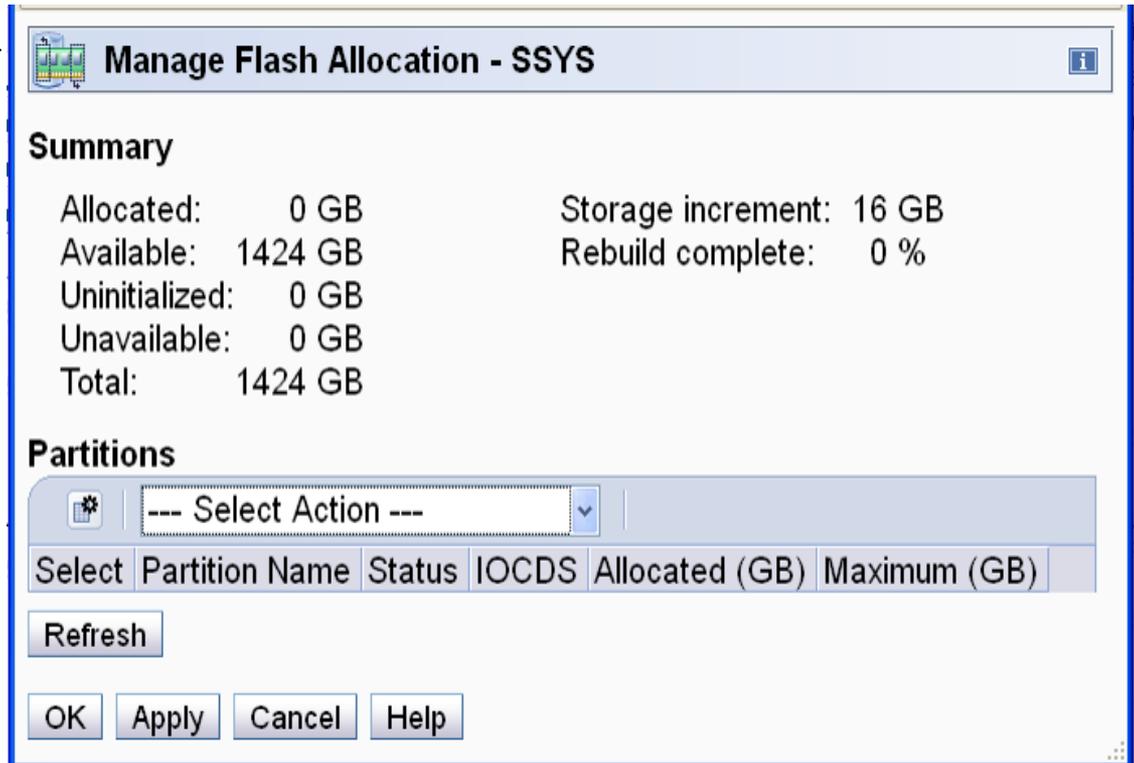

Manage Flash Allocation panel to define flash memory to a partition

Summary shows

Allocated – 0 GB

Available – 1424 GB

Manage Flash Allocation - SSYS

Improve Availability & Performance

Flash Express is intended to improve System z availability and performance

- ◆ **Slash latency delays from paging**
 - Flash Memory is much faster than HDD
 - Flash Memory is much slower than main memory
- ◆ **Help key workloads at critical processing times**
 - Accelerate start of day processing – batch to online
 - Handle paging spikes
- ◆ **Reduce frustrating delays from SVC Dump processing**
- ◆ **Enable the use of large 1 MB pageable pages**

z/OS and Flash memory

- ◆ **SCM can be added dynamically to z/OS system**
- ◆ **SCM is used for paging, as part of paging subsystem**
- ◆ **New fields in RMF reports**

z/OS Changes for SCM

New PAGESCM parameter in IEASYSxx defines amount of flash memory to be reserved for paging at IPL

- ◆ NONE - do not use flash memory for paging
- ◆ ALL – all flash memory is reserved for paging (default)
- ◆ 0, 0M, 0G, 0T - no flash memory is reserved for paging, allocated as needed for demand paging

New messages issued at IPL

- ◆ IAR032I USE OF STORAGE-CLASS MEMORY FOR PAGING IS NOT ENABLED – PAGESCM= NONE
- ◆ IAR031I USE OF STORAGE-CLASS MEMORY FOR PAGING IS ENABLED - PAGESCM=ALL, ONLINE=00032768M
- ◆ IAR031I USE OF STORAGE-CLASS MEMORY FOR PAGING IS ENABLED – PAGESCM=00000000M, ONLINE=00032768M

Operator commands to display SCM information

- ◆ D M=SCM online/offline status for SCM increments & usage
- ◆ D M=SCM(DETAIL) details for each online increment
- ◆ D ASM displays page data set and SCM information
- ◆ D ASM,SCM summary of SCM usage

Add Flash Memory to z/OS System

```

Paging Space Options

SCM provides additional flexibility for allocating page space

May be used for PLPA, Common, and local paging

Potential to improve performance of paging operations

PLPA and Common pages

At IPL, PLPA pages are paged to both SCM and PLPA page data set

PLPA data sets used for warm starts, SCM to resolve page faults

May omit PLPA and/or Common page data set by specifying *NONE* on the PAGE parameter in IEASYSxx

PLPA page data set is still needed for warm starts, as SCM data is not persistent across IPL

Local Page Data

Local page data set on DASD is required for paging VIO data

Page data sent to preferred storage medium based on response times

SCM for PLPA & Common

SYS1.PARMLIB(IEASYSxx)

```
PAGE>(*NONE*,  
      *NONE*,

LOCAL	0%	OK	C041	SAOSYS.SYSB.PAGE.LOCAL4
SCM	0%	OK	N/A	N/A

Our system has a minimum page data set configuration

Two local page data sets

Someone started a WebSphere application server with multiple servant regions

Demand for storage caused a paging spike

Without SCM, an auxiliary storage shortage would have occurred and possibly an IPL

With SCM, the pages were written to SCM and the application server regions initialized

Paging Spike - RMF Summary Report

Paging spike at 12.51.00 - demand paging jumps to 15243

Tested SVCDUMP times with paging to flash memory

Dumped the WebSphere Application Server address spaces (5.5 GB)

Compare the SVCDUMP times with and without flash memory

```
IEA045I AN SVC DUMP HAS STARTED AT TIME=16.52.58 DATE=12/11/2012

Flash Memory Experiences

HMC Manage Flash Allocation panel easy to navigate

Procedure to dynamically add and remove Flash memory is straight forward and uses familiar operator commands

Ability of Flash memory to handle a surprise paging spike avoiding auxiliary storage shortage

Our testing showed Flash memory reduced the SVC DUMP non-dispatchability and capture times

IBM Flash Express feature is designed to improve business application availability and performance

Reduce latency and provide large capacity for paging

- ◆ Ability to handle paging spikes
- ◆ Reduced time to capture data for SVCDUMPs

Dynamically add and remove Flash memory on z/OS system

Provides additional options for configuring paging space
