#### Notes:

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

IBM hardware products are manufactured from new parts, or new and serviceable used parts. Regardless, our warranty terms apply.

All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.

This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.

All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.

# Agenda

- Overview of Language Environment storage areas
  - Control blocks, stack, heap
  - Which can you control?
- How to control Language Environment Storage
- Tuning Storage
- More advanced tuning
- Sources of Additional Information

- Language Environment Control Blocks
  - Region level
    - Normally 1 region per address space
  - Process level
    - Normally 1 process per address space
  - Enclave level
    - Potentially many per address space
  - Thread level
    - Potentially very many per address space

# Language Environment Storage Areas

process - application

enclave - pgm - enclave

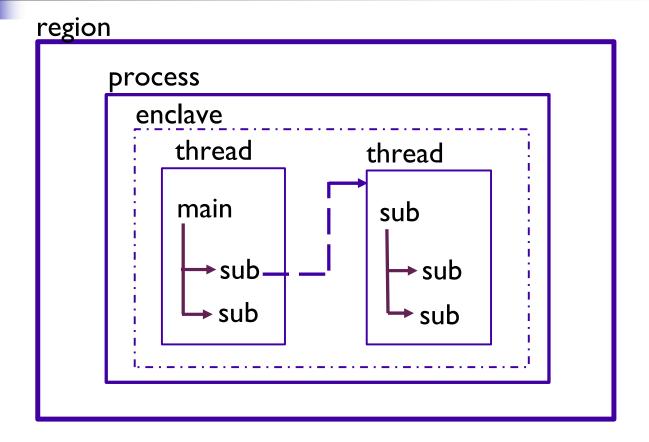

main

sub
sub
sub

- Language Environment Enclave
  - Every "main" program is a new enclave
  - Every "link" is a new enclave
  - Contains
    - CEECAA, CEEEDB, CEEOCB, stacks, heaps, environment variables, and much more!
  - "Extra" enclaves are expensive both to initialize and in storage usage.

# Language Environment Storage Areas

- Language Environment Thread
  - Created by
    - pthread\_create() (C/C++ pthread support)
    - ATTACH statement (PL/I multithreading support)
  - Contains
    - CEECAA, stacks, and a little more
  - Threads are not nearly as expensive as enclaves.

#### Language Environment Stacks

- Stacks
  - Last In, First Out structures
  - Allow programs to be reentrant
  - Thread level structures
    - "Main" programs have separate stacks
    - "Linked" programs have separate stacks
    - pthreads have separate stacks

- Language Environment supports 2 independent stacks
  - User stack (poorly named)
    - Used by user programs and Language Environment
  - Library stack
    - Used "rarely" by Language Environment
    - Always below the 16M line

# Language Environment Storage Areas

- DATA in stacks
  - "Chunks" are called stack segments
    - Made up of 1 or more DSAs
  - DSA Dynamic Save Area
    - Also called a "stack frame"
  - DSAs contain
    - Register Save Area (RSA)
    - NAB Next Available Byte
    - Automatic (local) variables
      - C int i;
      - PL/I declare i fixed;
      - NOT COBOL WORKING-STORAGE
        - COBOL LOCAL-STORAGE in stack

#### Language Environment Heaps

- Heaps
  - Completely random access
  - Allows storage to be dynamically allocated at runtime
- Enclave level control structures
  - Each 'main' has a separate stack and heap
  - Each 'link' causes a separate stack and heap
  - pthreads share a single heap for all threads

- Language Environment Heaps
  - Four independently maintained sets of heap segments all with similar layouts:
    - User Heap
      - COBOL WORKING-STORAGE
      - C/C++ (malloc or operator new)
      - PL/I dynamic storage (allocate)
    - LE Anywhere Heap
      - COBOL and LE above the line CBs
    - LE Below Heap
      - COBOL and LE below the line CBs
    - Additional Heap
      - Defined by the user

- Run-time options dealing with stacks
  - STACK(init,inc,ANY|BELOW,KEEP|FREE,dsInit,dsInc)
    - Init Initial size of storage "chunk" allocated and managed by LE for user stack
    - Inc When init is full, size of next storage "chunk" (increment)
    - ANY|BELOW Location of storage
      - ANY Anywhere in 2G virtual storage
      - Below Always below 16M line
        - Required when all31(OFF)
    - KEEP|FREE What to do when done with inc
      - KEEP Do not free the storage "chunks"
      - FREE Free the storage "chunks"
    - DsInit Initial size of storage "chunk" (XPLINK)
    - DsInc When initial full, size of next "chunk" (XPLINK)

- Run-time options dealing with stacks
  - LIBSTACK(init,inc,KEEP|FREE)
    - Init Initial size of storage "chunk" allocated and managed by LE for library stack
    - Inc When init is full, size of next storage "chunk" (increment)
    - KEEP|FREE What to do when done with inc
      - KEEP Do not free the storage "chunks"
      - FREE Free the storage "chunks"

NOTE: No ANY|BELOW, LIBSTACK always below the 16M line

- Run-time options dealing with stacks
  - THREADSTACK(ON|OFF,init,inc,ANY|BELOW,KEEP|FREE, dsInit,dsInc)
    - ON|OFF Whether or not to use THREADSTACK for pthreads
    - Init Initial size of storage "chunk" (like STACK)
    - Inc Increment size of storage "chunk" (like STACK)
    - ANY|BELOW Location of storage
      - ANY Anywhere in 2G virtual storage
      - Below Always below 16M line
        - Required when all31(OFF)
    - KEEP|FREE What to do when done with inc
      - KEEP Do not free the storage "chunks"
      - FREE Free the storage "chunks"
    - DsInit, Dsinc XPLINK "chunk" sizes

- Runtime options dealing with the heaps
  - HEAP(init,inc,ANY|BELOW,KEEP|FREE,int24,inc24)
    - User heap mostly application use
    - init Initial size of the "chunk" of storage obtained to be managed by LE for user heap
    - Inc When initial "chunk" is full, size of next "chunk" (minimum)
    - ANY|BELOW Location of "chunk"
      - Not sensitive to ALL31 setting
    - KEEP | FREE What to do when done with the increment when empty
      - KEEP
- Do not free the storage "chunks"
- FRFF
- Free the storage "chunks"
- int24 Initial size of the "chunk" of storage obtained
  - (if ANY specified but BELOW requested (minimum))
- inc24 Size of next "chunk"
  - (if ANY specified but BELOW requested (minimum))

- Runtime options dealing with the heaps...
  - ANYHEAP(init,inc,ANY|BELOW,KEEP|FREE)
    - Thread stack storage lives in anyheap!!! Tune if multi-threaded
    - LE use normally above the line
    - init Same as HEAP.
    - incSame as HEAP. (minimum)
    - ANY | BELOW Location of storage
    - KEEP | FREE Same as HEAP
  - BELOWHEAP(init,inc,KEEP|FREE)
    - LE use always below the line
    - init Same as HEAP.
    - inc- Same as HEAP. (minimum)
    - KEEP | FREE Same as HEAP

- STORAGE(getheap, freeheap, dsa alloc)
  - Getheap Initialize heap storage
    - NONE no overhead
    - One byte hex value to initialize storage with when heap element obtained
      - 00 similar to WSCLEAR option
      - Relatively low overhead
  - Freeheap Initial heap storage
    - NONE no overhead
    - One byte hex value to initialize storage with when heap element freed
      - Useful for debug purposes or security
      - Relatively low overhead

- STORAGE(getheap, freeheap, dsa alloc)
  - DSA alloc Initialize stack storage
    - NONE No initialization no overhead
    - CLEAR Entire unused initial stack segment is cleared just before the main program is given control – low overhead
    - A one byte hex value to initialize storage with when stack frame (DSA) is obtained
      - EXTREMELY HIGH OVERHEAD
      - EXTREMELY HIGH OVERHEAD
      - EXTREMELY HIGH OVERHEAD

- Simple program that makes lots of calls
  - STORAGE(,,none)

- Best ways to ensure the proper initial value for your variables
  - Use compiler initialization
  - Set them prior to use in your program

- Objectives
  - Use as little storage as possible
  - Have program run as efficiently as possible
- The above objectives are often at odds with each other. (But not always)
- One way to make a program run faster is to "throw" more storage at it.
  - Care must be taken to use storage wisely
  - Much of what we will talk about can be done without recompiling or reworking the program.

- Simple example
  - In a test environment (not production) use the RPTSTG run-time option.
  - A report will be generated describing the storage used by the program.
  - This information can be used to assist with better settings of Language Environment run-time options

#### Simple example

Storage Report for Enclave main 02/07/11 5:12:26 PM Language Environment V01 R12.00

- A bit more meaty!
  - Testcase requests 50000 random pieces of storage of sizes from 1 to 32K in size
  - Then the storage is freed.
  - We'll run the program without tuning
  - We'll then re-run the program (same random values) after tuning
  - Have we saved storage? Performance?

Untuned example

```

                                                                               496
           GO
                    PGM=*.DD
```

- What about those pesky Language Environment control blocks?
  - No externals to help
  - Effort can be made to reduce the number of enclaves
  - Use dynamic calls rather than linking to next program
  - Hard to see the results without using system tools... but let's try

- Simple program does a LINK to another program
  - A new enclave is created
  - This 2<sup>nd</sup> program continues to get storage until it runs out
  - It is able to obtain 21568K of storage

- Add to program to call down through 5 nested enclaves
  - Last enclave is able to obtain 20576K of storage
- Add to program to call down through 10 nested enclaves
  - Last enclave is able to obtain 19808K of storage
- Storage being consumed is to:
  - Load programs
  - Create enclave control blocks
    - This includes stacks and heaps
  - 1760K of storage usage (21568K-19808K)

- Change programs to use dynamic call rather than LINK
  - One call case 21728K of storage available
  - Five call case 21664K of storage available
  - Ten call case 21600K of storage available
- Note how much less storage is consumed.
  - Basically just the amount to load the programs
  - 128K for 10 calls deep (21728K-21600K)

#### A Real Life Example

- Software vendor's multi-threaded transaction server
  - Experienced significant delay due to storage thrashing
  - Followed similar methodology
    - Stacks tuned
    - Heaps tuned
    - Heap Pools turned on, tuned

	Real CPU Consumed (sec)	# API Calls	Avg Elapsed Time per call (sec)	Avg CPU per call (ms)	Min elapsed time (sec)	Max elapsed time (sec)
Baseline	405.68	53349	0.5302	6.91	0.0003	265.9225
After Tuning	106.51	61943	0.0033	1.56	0.0002	0.6142

#### Summary

- Storage run-time option has high overhead for initializing the stack
- Use RPTSTG to tune your stack, heap and other storage sizes
- KEEP is faster than FREE
- Use dynamic call versus LINK
  - Requires program update or recompile
