LAB – Part III – Testing and comparing the bufferpools	32
Step 1 – Customizing the JCL and Submitting the jobs	33
Step 2 – Evaluating the findings	36
Conclusion	48

Lab Objectives

This lab has the following objectives:

- 1) To compare the use and costs of above and below the bar bufferpool allocation
- 2) To familiarize administrators with the new parameters

General Lab Information and Guidelines

1. Any time the labels TEAM00 or TEAMXX are used, please replace the '00' or 'XX' with your team ID (TEAM01 – TEAM20).
2. These images were captured on queue managers QML1 and QML3, please use the queue manager assigned.
3. There are four queue managers for use in this workshop. Each team is assigned a primary queue manager as follows:
 - QML1 - TEAM01, TEAM05, TEAM09, TEAM13, TEAM17
 - QML2 - TEAM02, TEAM06, TEAM10, TEAM14, TEAM18
 - QML3 - TEAM03, TEAM07, TEAM11, TEAM15, TEAM19
 - QML4 – TEAM04, TEAM08, TEAM12, TEAM16, TEAM20
2. All teams should signon to the MPX1 LPAR.
3. The passwords for this lab will be provided by the workshop leaders.
4. Any difficulty with connectivity should be reported, but please remember that the connections may be slow.
5. To accommodate limited storage, JCL libraries have been set up for each team as shown below. Please note that you should use the JCL library indicated by TEAMXX where the XX is your team ID.

TEAM01.BPBAR.JCL
TEAM02.BPBAR.JCL
TEAM03.BPBAR.JCL
TEAM04.BPBAR.JCL
TEAM05.BPBAR.JCL
TEAM06.BPBAR.JCL
TEAM07.BPBAR.JCL
TEAM08.BPBAR.JCL
TEAM09.BPBAR.JCL
TEAM10.BPBAR.JCL...

LAB – Part I – Connecting to your queue manager

In this section, you will connect to your primary queue manager from the MQ Explorer. In the examples shown the connection is being made to QML1. Please use the queue manager assigned above.

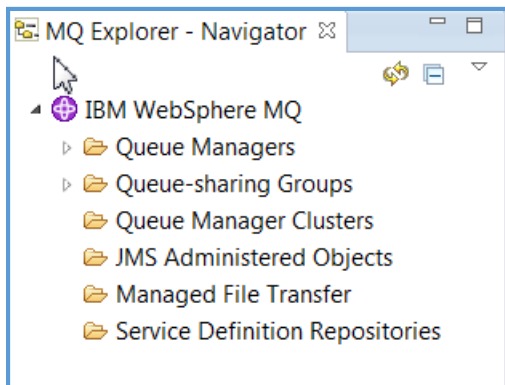

You will notice some differences between the captured images and the directions. They are due to some environmental differences between the VMWare image and running natively. There will also be some notes on features that are not yet working, these items are highlighted as ‘TechTips.’

Step 1 – Start the ATS MQ VMware image

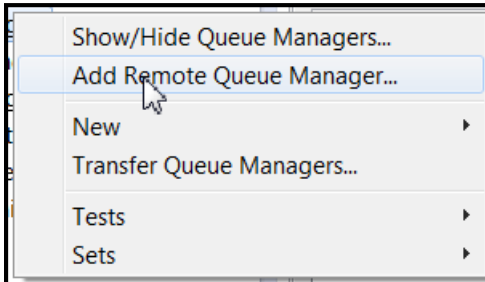

1. If not already started double click on the desktop link to the ATSWMQ VMWare image.
2. The password is that most secure of all passwords, passw0rd.

Step 2 – Defining your primary queue manager to the MQ Explorer

1. Start the MQExplorer . The Navigator pane should look something like this:

2. Right click on the Queue Managers folder and select Add Remote Queue Manager

3. On the Add Queue Manager panel, enter your primary queue manager name, make sure that 'Connect directly' is selected, and click on the Next button.

The screenshot shows the 'Add Queue Manager' dialog box. The title bar says 'Add Queue Manager'. The main heading is 'Select the queue manager and connection method'. Below this is a subtitle: 'Identify the queue manager to add and choose the connection method to use'. There is a text input field for 'Queue manager name:' containing the text 'QML1'. Below this is the question 'How do you want to connect to this queue manager?'. There are three radio button options: 'Connect directly' (which is selected), 'Connect using a client channel definition table', and 'Connect using an intermediate queue manager'. Each option has a brief description. At the bottom left, there is a note: 'Ensure that the specified queue manager is configured for remote access.' with a link to 'More information'. At the bottom right, there are four buttons: '< Back', 'Next >', 'Finish', and 'Cancel'.

Add Queue Manager

Select the queue manager and connection method

Identify the queue manager to add and choose the connection method to use

Queue manager name:

How do you want to connect to this queue manager?

☒ Connect directly
This option creates a new connection to the queue manager (recommended)

☐ Connect using a client channel definition table
This option uses a CCDT to create a new connection to the queue manager

☐ Connect using an intermediate queue manager
This option uses an existing connection from another queue manager
(Recommended when new connections are restricted)

Ensure that the specified queue manager is configured for remote access. [More information](#)

TECHTIP: For the queue manager name and many other fields CASE matters. All the z/OS queue managers use upper case names.

4. In the host name or IP address field and the port number fields enter the values that match your queue manager as shown in this table below. Then click on the 'Next' button.

Queue Manager	Host Name	IP address	Port
QML1	mpx1	9.82.31.252	1417
QML2	mpx2	9.82.31.253	1417
QML3	mpx1	9.82.31.252	1418
QML4	mpx2	9.82.31.253	1418

Add Queue Manager

Specify new connection details
Provide details of the connection you want to set up

Queue manager name: QML1

Connection details

Host name or IP address: 9.82.31.252

Port number: 1417

Server-connection channel: SYSTEM.ADMIN.SVRCONN

☐ Is this a multi-instance queue manager?

Connection details to second instance

Host name or IP address:

Port number: 1414

Server-connection channel: SYSTEM.ADMIN.SVRCONN

☐ Automatically connect to this queue manager at startup or if the connection is lost

☒ Automatically refresh information shown for this queue manager

Refresh interval (seconds): 300

< Back Next > **Finish** Cancel

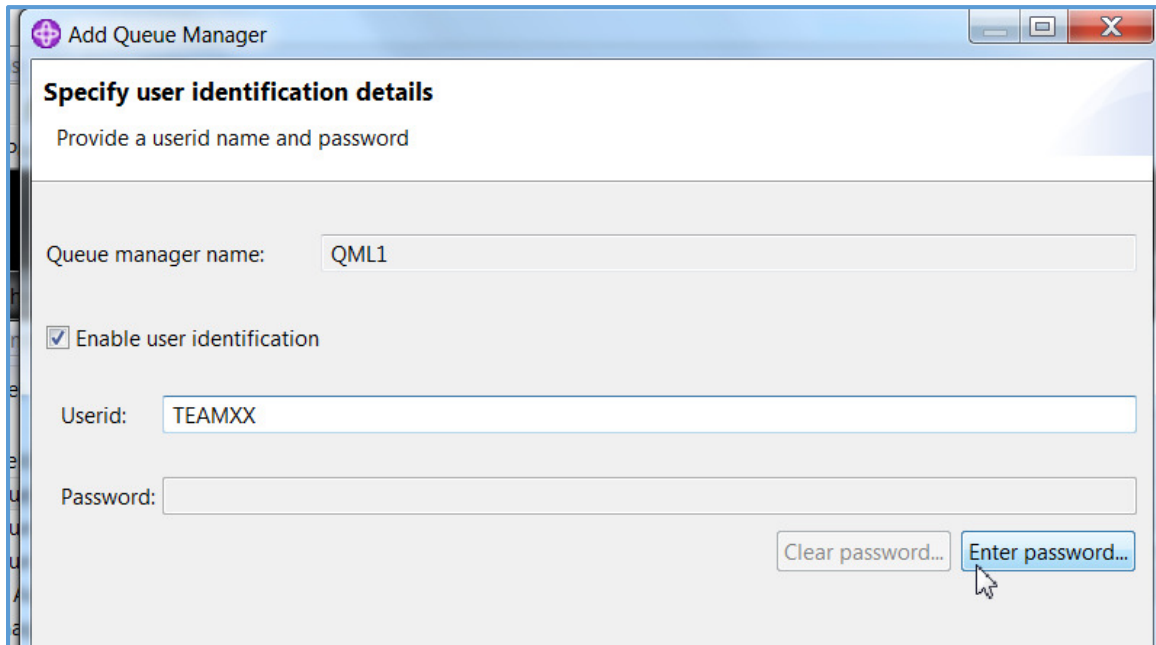

5. On the Specify exit details, click on the Next button.

The screenshot shows a Windows-style dialog box titled "Add Queue Manager". The main heading is "Specify security exit details" with a subtitle "Provide the name and location of a security exit and optionally some exit data".

Fields and controls include:

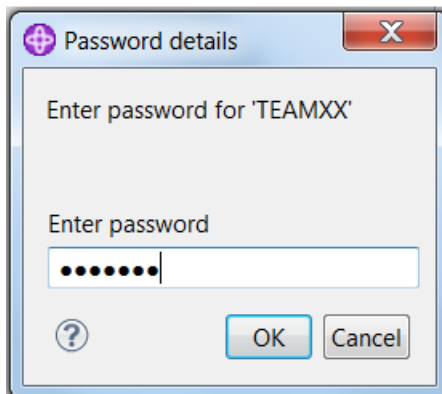

- "Queue manager name:" with a text box containing "QML1".
- An unchecked checkbox labeled "Enable security exit".
- "Exit name:" with an empty text box.
- Two radio button options for the exit location:
 - "in directory" (selected) with a text box containing "C:\ProgramData\IBM\MQ\exits\" and a "Browse..." button.
 - "in jar" with an empty text box and a "Browse..." button.
- "Exit data:" with a large empty text area.
- A help icon (?) in the bottom left.
- Four buttons in the bottom right: "< Back", "Next >", "Finish" (highlighted with a blue border), and "Cancel".

6. On the 'Specify user identification details' panel, enter your team id and click on the 'Enter password' button.

The screenshot shows a window titled 'Add Queue Manager' with a sub-panel titled 'Specify user identification details'. Below the title is the instruction 'Provide a userid name and password'. The 'Queue manager name:' field contains 'QML1'. The 'Enable user identification' checkbox is checked. The 'Userid:' field contains 'TEAMXX'. The 'Password:' field is empty. At the bottom right, there are two buttons: 'Clear password...' and 'Enter password...'. A mouse cursor is pointing at the 'Enter password...' button.

7. On the 'Enter password' panel, enter the password 'b00tcamp', and click the OK button.

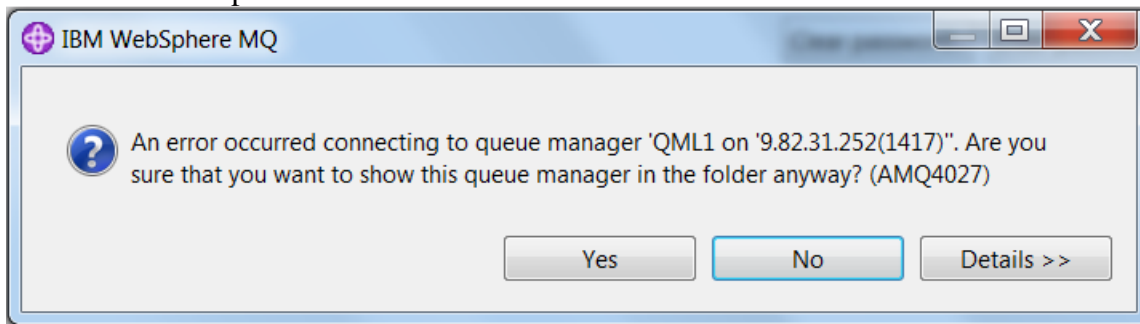

The screenshot shows a dialog box titled 'Password details'. It contains the text 'Enter password for 'TEAMXX'' and a label 'Enter password' above a password input field. The input field shows seven dots, indicating the password is masked. At the bottom, there is a question mark icon, an 'OK' button, and a 'Cancel' button.

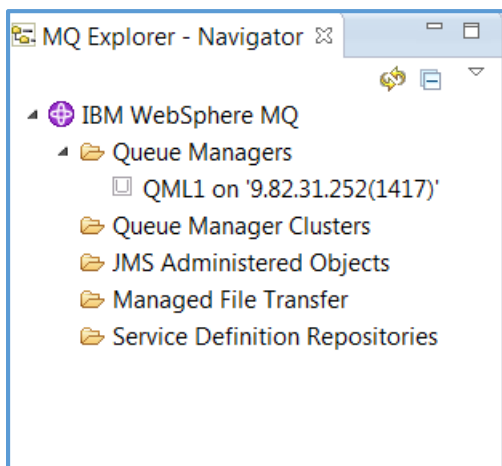

8. Then click the 'Finish' button.
9. You may get a security error, like what is shown here. If you do, click on the Close button.

10. The next message is to verify that you want to add the queue manager to your folder in spite of the error. Click 'Yes'.

11. The navigator panel should show the queue manager, but in an unconnected state.

Step 3 – Checking for errors in the queue manager address space

1. To check the error as shown in the queue manager, start the PCOMM session for MPX1 if your primary queue manager is an odd number. If your primary queue manager is an even number, start the MPX2 session. Even if you do not get the error, please perform these steps to see what is going on in the queue manager. To signon, enter TSO and your team ID as shown (colors are changed to preserve ink):

```

Your IP: 192.168.0.201                               Terminal: MPX10003
03/24/14                                              17:07:56
          *** Advanced Technical Skills(ATS) Wildfire Environment ***

Enter  TSO    for TSO on MPX1 ,
       CICS1  for CICS region MPX1CIC1 on MPX1 , or:
       CICS2  for CICS region MPX1CIC2 on MPX1 , or:

          USS xxxxxxxx          to access known APPLID xxxxxxxx

Enter Command ==>  tso teamxx_
Mâ B 24/031
```

2. Enter your password as shown, and hit the enter key.

```

----- TS0/E LOGON -----

Enter LOGON parameters below:                                RACF LOGON parameters:

Userid   ==> TEAMXX                                           New Password ==>
Password ==> _                                                Group Ident  ==>

```

12. Why do you think the password was invalid? Hint: remember the TechTip? This environment does not do uppercase translation, as some might. The next steps will correct the connection information.

TECHTIP 2: User ID and password verification against RACF, or another ESM, is now done automatically when sent to the queue manager. This behavior may be different from what customers have seen in the past.

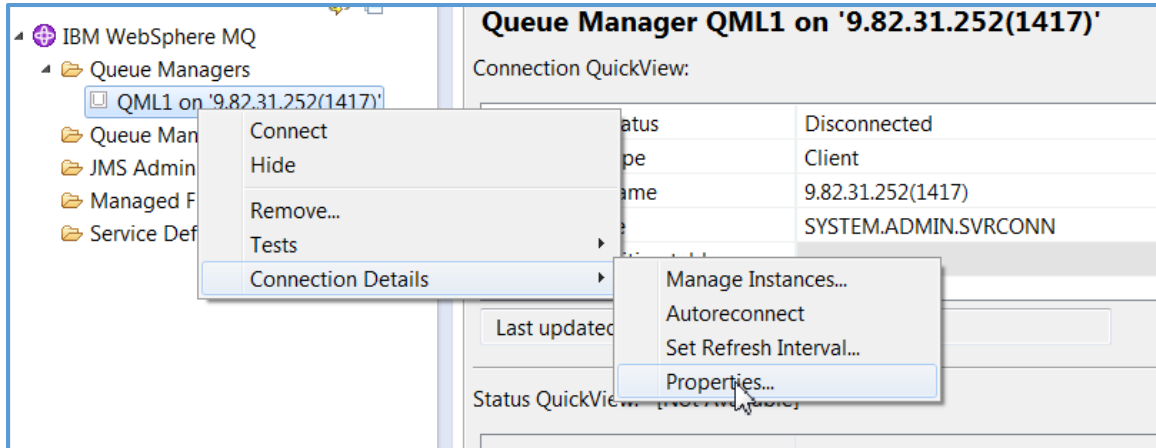

TECHTIP 3: At the time this lab was created, the delivered sample security exit, CSQ4BCX3, causes an abend when used. Specifically, the following is seen in the JES log:

```
10.13.55 STC13337 +CSQX111E QML3 CSQXDISP User channel exit error, TCB=008CC090 058
058 reason=5C6000-00E70FFF
10.13.55 STC13337 +CSQX599E QML3 CSQXRESP Channel SYSTEM.ADMIN.SVRCONN ended
abnormally
```

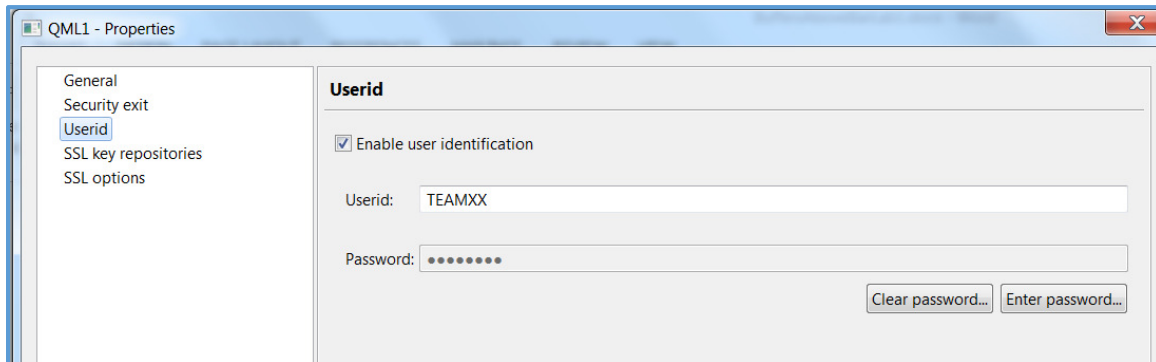

This exit was used in V7.1 to do the user ID and password checking. This has been reported to the development lab.

Step 4 – Repairing the connection information – may not be required

1. Return to the MQ explorer and right click on the queue manager name, select Connection Details, then Properties.

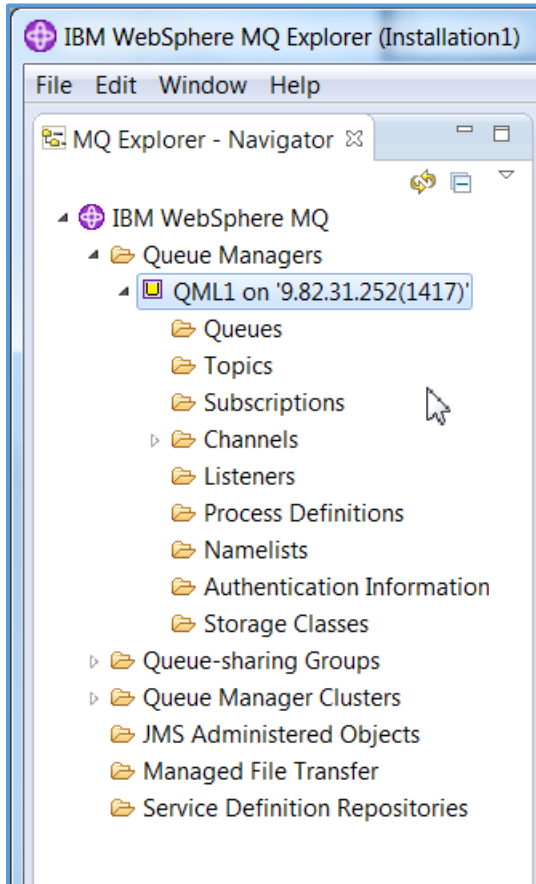

2. On the Queue manager properties display, select the Userid tab, then click on the Enter password button.

3. Enter the password on the Password details pane in UPPER CASE and click the OK button.

4. Click the OK button when the Properties panel has returned.
5. Right click on the queue manager name, and select 'Connect'
6. The connection should work properly at this point. The panel should show the connected queue manager, and you should then be able to expand that to show the resource definitions.

LAB – Part II - Defining your queues

Use the WMQ Explorer to define your queues for these exercises. If your explorer session has been shut down, please restart it and connect to your primary queue manager.

For this test, two queues need to be defined, one on each predefined storage class. These are based on your team ID as shown:

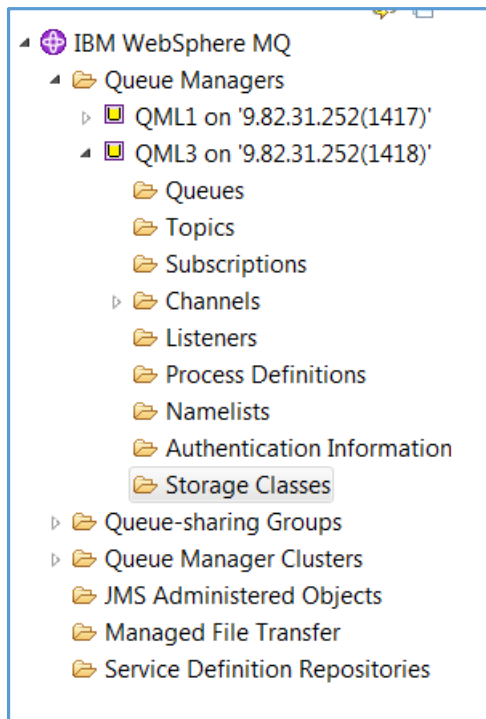

Team	Queue Manager	Below the Bar	Above the Bar
TEAM01	QML1	STGCLS10	STGCLS11
TEAM02	QML2	STGCLS10	STGCLS11
TEAM03	QML3	STGCLS10	STGCLS11
TEAM04	QML4	STGCLS10	STGCLS11
TEAM05	QML1	STGCLS12	STGCLS13
TEAM06	QML2	STGCLS12	STGCLS13
TEAM07	QML3	STGCLS12	STGCLS13
TEAM08	QML4	STGCLS12	STGCLS13
TEAM09	QML1	STGCLS14	STGCLS15
TEAM10	QML2	STGCLS14	STGCLS15
TEAM11	QML3	STGCLS14	STGCLS15
TEAM12	QML4	STGCLS14	STGCLS15
TEAM13	QML1	STGCLS16	STGCLS17
TEAM14	QML2	STGCLS16	STGCLS17
TEAM15	QML3	STGCLS16	STGCLS17
TEAM16	QML4	STGCLS16	STGCLS17
TEAM17	QML1	STGCLS18	STGCLS19
TEAM18	QML2	STGCLS18	STGCLS19
TEAM19	QML3	STGCLS18	STGCLS19
TEAM20	QML4	STGCLS18	STGCLS19

Step 1 – Verify the storage classes

- 1) The storage classes can be displayed from the MQ Explorer, but that does not give all the critical bit of information about the location of the bufferpool the storage class uses.

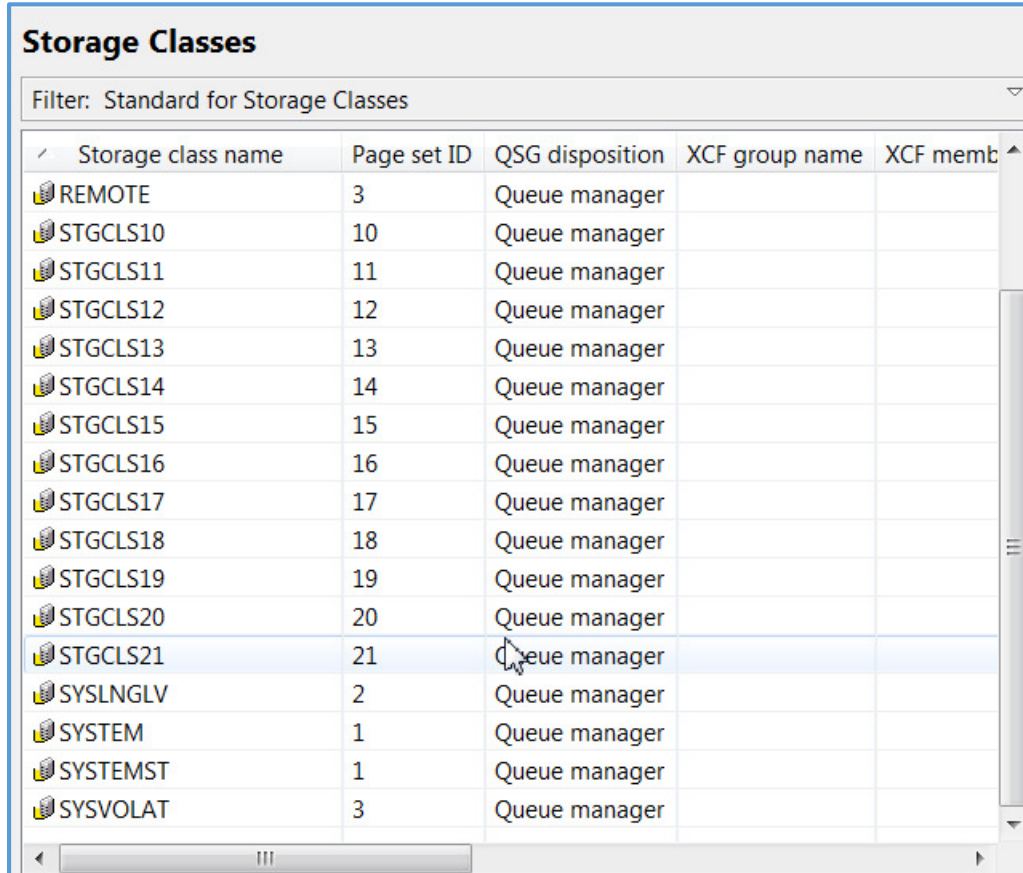

TECHTIP 4: The storage class display has never shown the association with a bufferpool. There has also never been a Bufferpool display from the MQ Explorer, or a 'Display Usage' capability that would show the relationship between the STGCLASS and bufferpool. To get this information, you have to use the commands in z/OS and review the JES log.

- 2) From the queue manager resource list in the Navigator pane, click on the Storage Classes folder to display the currently defined classes.

TECHTIP 5: MQ V8 increased the number of available bufferpools to 99, the same number of pagesets available. For customers concerned about performance and isolation of resource use, in particular those customers using QREP, defining a one-to-one relationship between the bufferpool and pageset is recommended for application queues. That relationship helps identify problem area more quickly, and in some cases, move resources around to alleviate temporary performance and capacity issues more easily.

3) The storage class display from the V8 version of the MQ Explorer looks as shown:

Filter: Standard for Storage Classes				
Storage class name	Page set ID	QSG disposition	XCF group name	XCF memb
REMOTE	3	Queue manager		
STGCLS10	10	Queue manager		
STGCLS11	11	Queue manager		
STGCLS12	12	Queue manager		
STGCLS13	13	Queue manager		
STGCLS14	14	Queue manager		
STGCLS15	15	Queue manager		
STGCLS16	16	Queue manager		
STGCLS17	17	Queue manager		
STGCLS18	18	Queue manager		
STGCLS19	19	Queue manager		
STGCLS20	20	Queue manager		
STGCLS21	21	Queue manager		
SYSNLGLV	2	Queue manager		
SYSTEM	1	Queue manager		
SYSTEMST	1	Queue manager		
SYSVOLAT	3	Queue manager		

- 4) Return to the TSO session, and in the JES message log of the queue manager address space of your primary queue manager, enter the command:

/cpf display usage

Where cpf is the command prefix string for the queue manager. In the ATS environment the cpf is the subsystem ID. (QML1, QML2, QML3, or QML4)

```
SDSF OUTPUT DISPLAY QML3MSTR STC13395 DSID      2 LINE 376      COLUMNS 02- 133

```

What may be different on the display is the number of stealable buffers and percentage. If no queues have been defined and used yet in the bufferpool these values will be different. Please also note the Page class and location values, these are new for V8.

TECHTIP 6: From the MQ V8 InfoCenter on the Location value:

LOCATION(LOC)(BELOW or ABOVE)

The LOCATION or LOC parameter specify where the memory used by the specified buffer pool is located. LOCATION and LOC are synonyms and either, but not both, can be used. This memory location can be either ABOVE (64 bit) or BELOW (31 bit) the bar. Valid values for this parameter are BELOW or ABOVE, with BELOW being the default. ABOVE can only be specified if OPMODE(NEWFUNC, 800) is in effect. BELOW can be specified regardless of OPMODE(NEWFUNC, 800) being used and has the same effect as not specifying the LOCATION parameter.

When altering a buffer pool care should be taken to make sure there is sufficient storage available if increasing the number of buffers or changing the LOCATION value.

TECHTIP 7: From the MQ V8 InfoCenter on the Page class value:

PAGECLAS(4KB or FIXED4KB)

Optional parameter that describes the type of virtual storage pages used for backing the buffers in the buffer pool.

This attribute applies to all buffers in the buffer pool, including any that are added later as a result of using the ALTER BUFFPOOL command. The default value is 4 KB, which means that pageable 4 KB pages are used to back the buffers in the pool.

4 KB is the only valid value if the buffer pool has its location attribute set to BELOW. If the buffer pool has its LOCATION attribute set to ABOVE, it is also possible to specify FIXED4KB. This means that fixed 4 KB pages, which are permanently in real storage and will never be paged out to auxiliary storage, are used to back the buffers in the buffer pool.

FIXED4KB can only be specified if OPMODE(NEWFUNC, 800) is in effect whereas 4 KB can be specified regardless of the setting of OPMODE(NEWFUNC, 800).

The PAGECLAS attribute of a buffer pool can be altered at any time. However, the alteration only takes place when the buffer pool switches location from above the bar, to below the bar, or the other way round. Otherwise, the value is stored in the log of the queue manager and is applied when the queue manager next restarts.

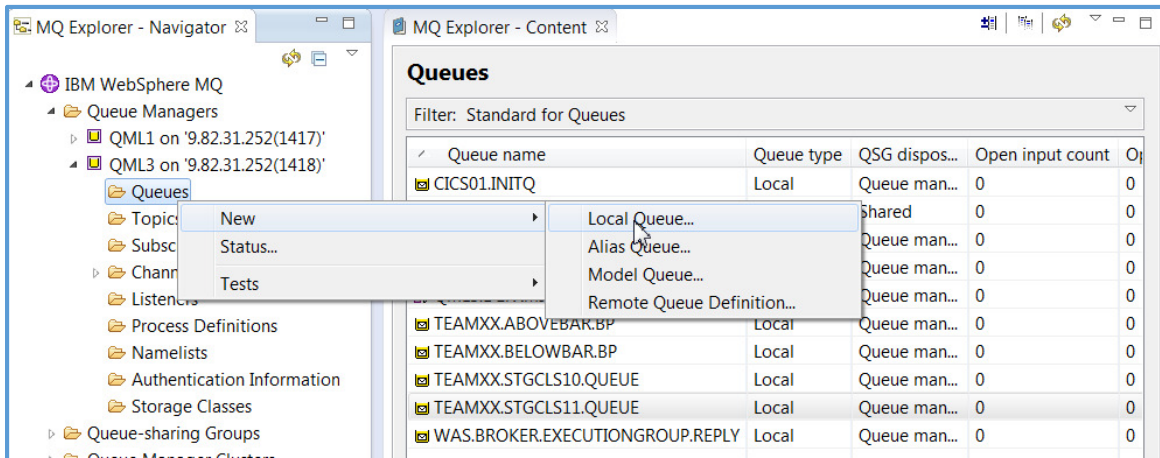

When you specify PAGECLAS(FIXED4KB) the whole buffer pool is backed by page-fixed 4 KB pages, so ensure that there is sufficient real storage available on the LPAR. Otherwise, the queue manager might not start up, or other address spaces might be impacted; for more information, see Address space storage.

See WebSphere MQ Support Pac MP16: WebSphere MQ for z/OS - Capacity planning & tuning for advice on when to use the FIXED4KB value of the PAGECLAS attribute.

Please note that the bufferpools allocated for the lab are not fixed, as we do not want to have real storage issues.

- 6) Verify from the display that the even numbered bufferpool defined for your test is below the bar, and the odd numbered bufferpool is above. Please see the table on following the heading LAB – Part II - Defining your queues on page 18.

- 7) To define the below the bar queue, right click on the 'Queues' folder on the MQ explorer navigator pane for your queue manager and select 'New' the 'Local queue' as shown.

- 8) Enter the queue name, please use all caps, as TEAMXX.BBAR.QUEUE, where the 'XX' is replaced with your team number. Then click on 'Next'.

New Local Queue

Create a Local Queue

Enter the details of the object you wish to create

Name:

TEAMXX.BBAR.QUEUE

Select an existing object from which to copy the attributes for the new object.

SYSTEM.DEFAULT.LOCAL.QUEUE Select...

When this wizard completes, another wizard can be started automatically to create a matching object.

☐ Start wizard to create a matching JMS Queue

< Back Next > Finish Cancel

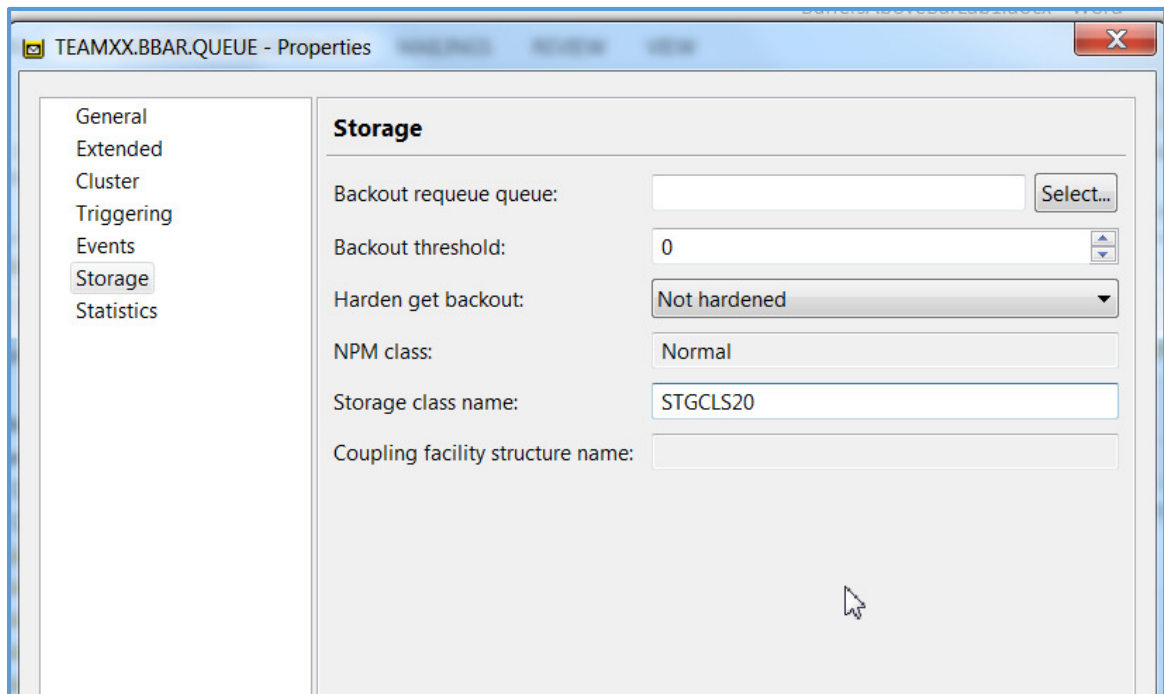

- 9) Select the 'Extended' tab and change the default 'Shareability' and 'Default input open option' values to 'Shareable' and 'Input shared' respectively. Then select the 'Storage' tab.

The screenshot shows the 'New Local Queue' dialog box with the 'Extended' tab selected. The dialog has a title bar 'New Local Queue' and a subtitle 'Change properties of the new Local Queue'. On the left, there is a list of tabs: General, Extended (selected), Cluster, Triggering, Events, Storage, and Statistics. The main area displays various properties for the queue:

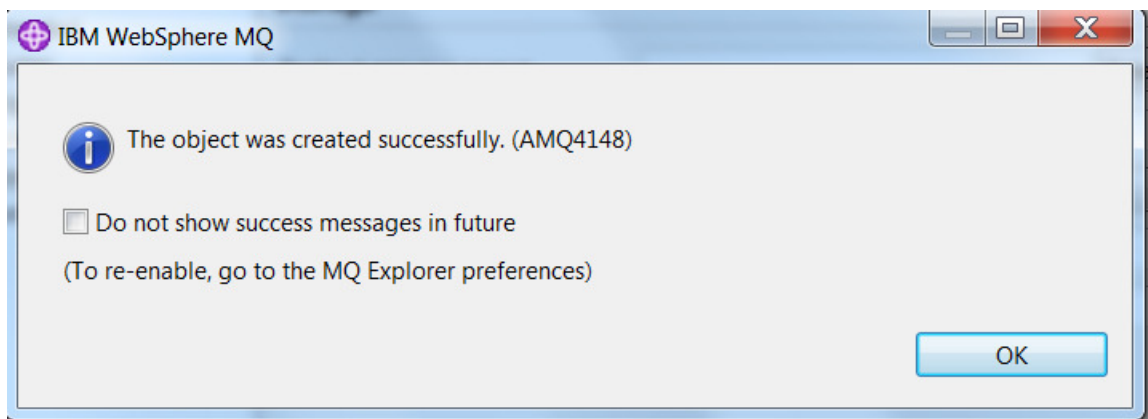

Extended	
Max queue depth:	999999999
Maximum message length (bytes):	4194304
Shareability:	Shareable
Default input open option:	Input shared
Message delivery sequence:	Priority
Retention interval (hours):	999999999
Definition type:	Predefined
Index type:	None
Default read ahead:	No

At the bottom of the dialog, there are four buttons: '< Back', 'Next >', 'Finish' (highlighted in blue), and 'Cancel'. A mouse cursor is pointing at the 'Finish' button.

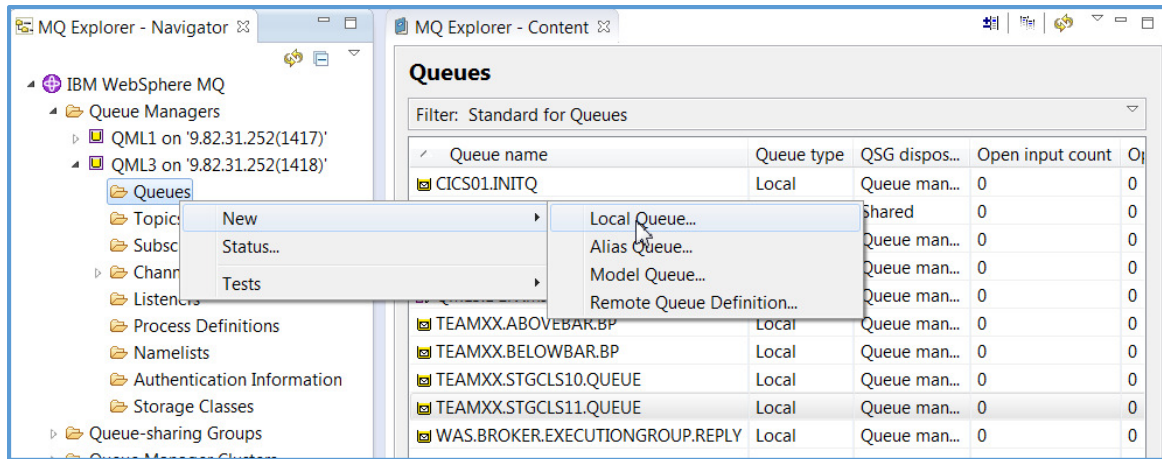

- 10) Replace the Storage class name 'DEFAULT' with the storage class name for the below the bar class defined for your team ID. The example shows STGCLS20, yours will be different. Then click on the 'Finish' button.

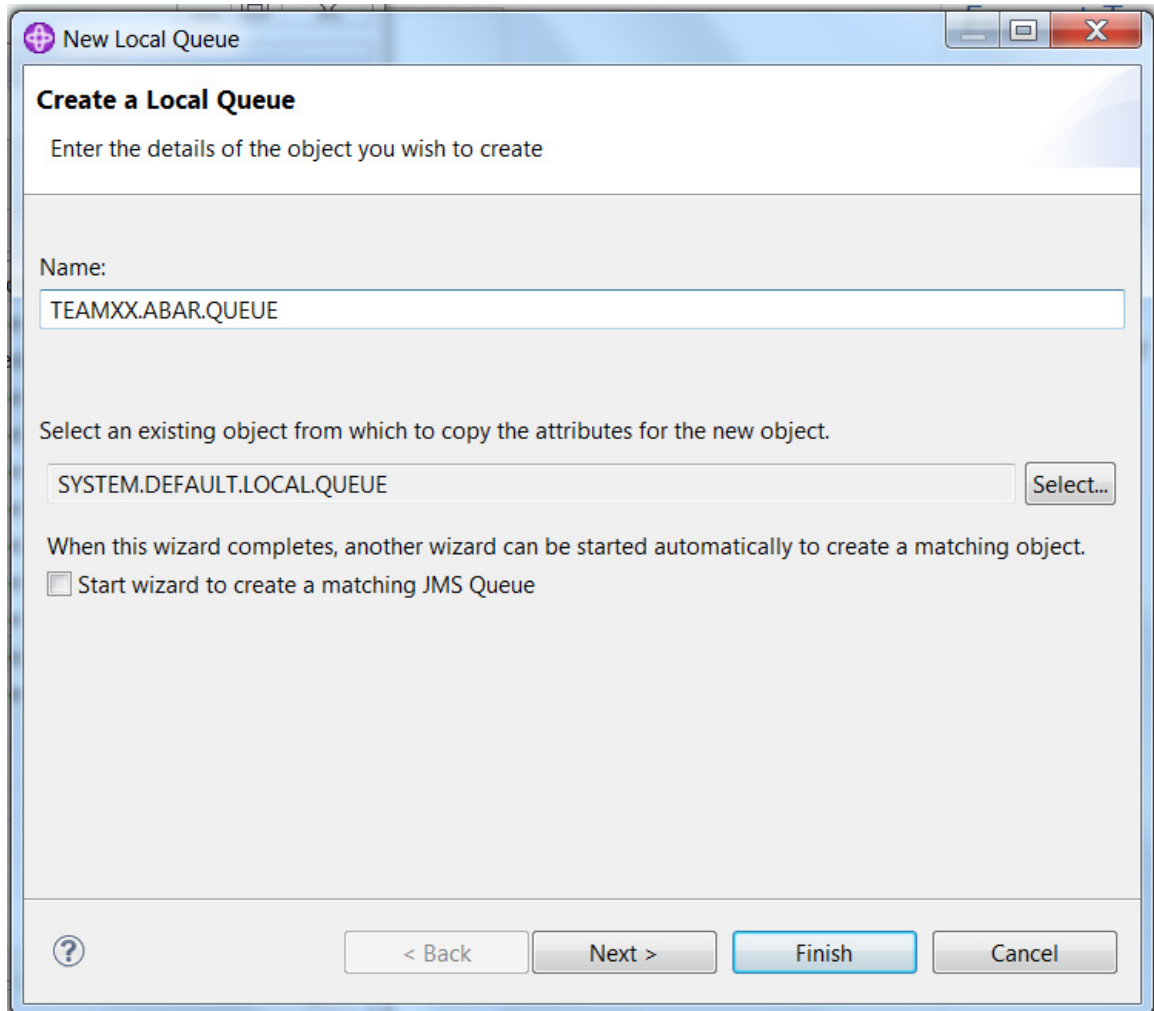

- 11) The object defined successfully message should be displayed. You can turn it off so it is not displayed again, or leave it on as you prefer.

- 12) To define the above the bar queue, right click on the 'Queues' folder on the MQ explorer navigator pane for your queue manager and select 'New' the 'Local queue' as shown.

- 13) Use the queue name 'TEAMXX.ABAR.QUEUE' replacing the XX with the team number assigned, and click the 'Next' button.

- 14) On the 'Extended' tab, alter the default 'Shareability' and 'Default input open option' values to 'Shareable' and 'Input shared' respectively. Then select the 'Storage' tab.

The screenshot shows the 'New Local Queue' dialog box with the 'Extended' tab selected. The 'Change properties' section is active, and the 'Extended' tab is highlighted in the left sidebar. The 'Extended' tab contains the following properties:

Property	Value
Max queue depth:	999999999
Maximum message length (bytes):	4194304
Shareability:	Shareable
Default input open option:	Input shared
Message delivery sequence:	Priority
Retention interval (hours):	999999999
Definition type:	Predefined
Index type:	None
Default read ahead:	No

At the bottom of the dialog, there are four buttons: '< Back', 'Next >', 'Finish', and 'Cancel'. The 'Finish' button is highlighted in blue.

- 15) Replace the Storage class name 'DEFAULT' with the storage class name for the above the bar class defined for your team ID. The example shows STGCLS21, yours will be different. Then click on the 'Finish' button.

LAB – Part III – Testing and comparing the bufferpools

The key advantage of above the bar bufferpools is the ability to hold many more messages in memory, avoiding I/O to the pagesets. In this exercise we are not able to demonstrate that, but we are focusing on the comparison of runtime costs. Above the bar addressing can be slightly more expensive in CPU costs, but far less expensive than I/O!

For anyone with experience of DB2 moving buffers above the bar, the initial implementation was reportedly much more expensive than below the bar. MQ for z/OS development has learned from that experience, and has the advantage of newer versions of the operating system.

These tests are designed to compare the costs, and more importantly give some sample tests that customer can reproduce in their environments. It uses the IP13 SupportPac to provide the sample programs, the older version of the MP16 SupportPac to evaluate the MQ SMF data (we will be using canned data, not running the jobs), and standard MQ commands.

Two sets of tests will be run. The first will compare the run characteristics of below and above bufferpools where no I/O has to be done. The second will compare them when I/O does take place. We would caution everyone running these tests, the numbers presented were gathered when the environment was not being used for any other testing. Your results may (probably will!) vary. A major difference in performance characteristics is when z/OS paging occurs in the environment, a situation that we in ATS have observed from time to time.

Step 1 – Customizing the JCL and Submitting the jobs

- 1) In the TSO session enter =3.4 in the command line to navigate to the Data Set List Utility panel, and enter TEAMXX.BP*, replacing the XX with your team number in the Dsname level field. Hit the enter key to display the list of data sets.

```

                                Data Set List Utility
Option ==> _

                                More:      +
      blank Display data set list      P Print data set list
      V Display VTOC information      PV Print VTOC information

Enter one or both of the parameters below:
Dsname Level . . . TEAMXX.BP*
Volume serial . .

Data set list options
Initial View
2  1. Volume
   2. Space
   3. Attrib
   4. Total
Enter "/" to select option
/  Confirm Data Set Delete
/  Confirm Member Delete
/  Include Additional Qualifiers
/  Display Catalog Name
   Display Total Tracks
   Prefix Dsname Level
  
```

- 2) Edit the 'TEAMXX.BPBAR.JCL' data set by entering a 'e' in the command column as shown.

```

DSLIS - Data Sets Matching TEAMXX.BP*
Command ==>
                                Row 1 of 1
                                Scroll ==> CSR

Command - Enter "/" to select action
                                Tracks %Used  XT
-----
e_      TEAMXX.BPBAR.JCL
                                150    1    1
***** End of Data Set list *****
  
```

- 3) Select the V8NOIO10 member and apply the following changes:
 - a) Change the 'TEAM??' value to your team number for all occurrences.

```

EDIT      TEAMXX.BPBAR.JCL (V8NOIO10) - 01.07                      Columns 00001 00080
Command ==> c TEAM?? TEAMXX all_                                Scroll ==> CSR
***** ***** Top of Data *****
000001 //TEAM??IO JOB (????,????), 'BBAR No IO', NOTIFY=????????
000002 /*
000003 /* THE FIRST STEP IS TO LOAD 300 MESSAGES ON A QUEUE THAT SHOULD NOT GET
000004 /* WRITTEN TO THE PAGESET, IN BUFFERPOOL ONLY
000005 /*
000006 //PROCLIB JCLLIB ORDER=(TEAM??,BPBAR.JCL)
000007 // SET STEPLIB=WMQICPV6
000008 // SET APPLD= 'TEAM??,IP13.LOAD'
000009 // SET MQLD1='WMQ800.SCSQLOAD'
000010 // SET MQLD2='WMQ800.SCSQAUTH'
000011 // SET MQLD3='WMQ800.SCSQLOAD'
000012 // SET THISPDS='TEAM??,BPBAR.JCL'
000013 // SET QM='QML?'
000014 // SET SUMMARY='TEAM??,DOCUMENT.SUMMARY'
000015 // SET DB2='DSNA*' DB2 NAME USED IN REPORTING CPU
    
```

- b) Change the 'QML?' to the queue manager you are using.

```

EDIT      TEAMXX.BPBAR.JCL (V8NOIO10) - 01.07                      CHARS 'TEAM??' changed
Command ==> c QML? QML3 all_                                Scroll ==> CSR
***** ***** Top of Data *****
==CHG> //TEAMXXIO JOB (????,????), 'BBAR No IO', NOTIFY=????????
000002 /*
000003 /* THE FIRST STEP IS TO LOAD 300 MESSAGES ON A QUEUE THAT SHOULD NOT GET
000004 /* WRITTEN TO THE PAGESET, IN BUFFERPOOL ONLY
000005 /*
==CHG> //PROCLIB JCLLIB ORDER=(TEAMXX, BPBAR.JCL)
000007 // SET STEPLIB=WMQICPV6
==CHG> // SET APPLD= 'TEAMXX,IP13.LOAD'
000009 // SET MQLD1='WMQ800.SCSQLOAD'
000010 // SET MQLD2='WMQ800.SCSQAUTH'
000011 // SET MQLD3='WMQ800.SCSQLOAD'
==CHG> // SET THISPDS='TEAMXX, BPBAR.JCL'
000013 // SET QM='QML?'
==CHG> // SET SUMMARY='TEAMXX,DOCUMENT.SUMMARY'
    
```

- c) Save the member by entering 'save' on the command line, r by exiting the member via the F3 key
- 4) Make the same changes to these other members of the dataset:
 - V8NOIO11
 - V8YSIO10
 - V8YSIO11

- 5) Each job has four steps

Stepname	Program executed	Purpose
LOADQ	OEMPUTX from IP13	Loads 4K messages onto the specified queue
LOADUSE	CSQUTIL	Issues a DISPLAY USAGE command to show the current Buffer and pageset use
MGETQ	MGET from IP13	Reads the messages from the specified queue
MQGETUSE	CSQUTIL	Issues a DISPLAY USAGE command to show the current Buffer and pageset use

- 6) Reopen V8NOIO10 and submit the JCL. The JCL does notify when it job is complete, but you may have to hit the enter key a couple of times to get the notification.

```
16.11.19 JOB13401 $HASP165 TEAMXX10 ENDED AT WSC300  MAXCC=0000 CN(INTERNAL)
*** ■
```

- 7) If the job does not return fairly quickly, chances are good that it has been submitted to run from the wrong LPAR. For example, if the job is referencing an even number queue manager and is submitted to run on MPX1 it will continue to try to access an unknown queue manager for some time. If that is the case, purge the job and resubmit from the correct LPAR.
- 8) Follow the same steps for submitting the other JCL members, waiting for each job to complete before submitting the last one. This is very important, as the running two jobs against the same resource pool will contaminate the results.

Step 2 – Evaluating the findings

- 1) Once all the jobs have run to completion, navigate the SDSF status display panel. Use =SDSF.ST in the command line of any TSO screen. If you do not see your jobs in the list, the prefix probably needs to be changed. Use the command 'prefix TEAMXX*' where the XX is replaced with your team number.

Display Filter View Print Options Search Help											

SDSF STATUS DISPLAY ALL CLASSES						LINE 1-5 (5)					
COMMAND INPUT ==>						SCROLL ==> CSR					
NP	JOBNAME	JOBID	Owner	PrtY	Queue	C	Pos	SAff	ASys	Status	PrtDest
	TEAMXX	TSU13389	TEAMXX	15	EXECUTION			MPX1	MPX1		LOCAL
	TEAMXXIO	JOB13404	ELKINSC	1	PRINT	A	632				LOCAL
	TEAMXXIO	JOB13403	ELKINSC	1	PRINT	A	631				LOCAL
	TEAMXXIO	JOB13402	ELKINSC	1	PRINT	A	630				LOCAL
■	TEAMXXIO	JOB13401	ELKINSC	1	PRINT	A	629				LOCAL

- 2) Use the question mark to expand the first job run, the one with the lowest job ID number.

SDSF JOB DATA SET DISPLAY - JOB TEAMXXIO (JOB13401) LINE 1-7 (7)												
COMMAND INPUT ==> ■ SCROLL ==> CSR												
NP	DDNAME	StepName	ProcStep	DSID	Owner	C	Dest	Rec-Cnt	Page-Cnt	Byte-Cnt	CC	PrMod
	JESMSG LG	JES2		2	ELKINSC	S	LOCAL	25		1,320	1	LINE
	JESJCL	JES2		3	ELKINSC	S	LOCAL	57		2,806	1	LINE
	JESYSMSG	JES2		4	ELKINSC	S	LOCAL	177		12,713	1	LINE
	SYSPRINT	LOADQ		106	ELKINSC	S	LOCAL	44		2,005	1	LINE

	SYSPRINT	MGETUSE		109	ELKINSC	S	LOCAL	48		2,777	1	LINE

- 3) Select the LOADQ SYSPRINT file. If unfamiliar with the output of OEMPUTX, please read the documentation on the test job from the IP13 SupportPac.

- 4) Page down until the 'Total Transactions' thru 'Avg App CPU' is shown.

```
Total Transactions   : 300
Elapsed Time        :    0.016 seconds
Application CPU Time:    0.012 seconds  (76.8%)
Transaction Rate    : 19244.340 trans/sec
-----
Round trip per msg  :          51 microseconds
Avg App CPU per msg :          39 microseconds
-----
```

Make note of the following information from the test:

Total Transactions: _____
Transaction Rate: _____
Round trip per msg: _____
Avg App CPU per msg: _____

- 5) Return to the output list and select the SYSPRINT from the LOADUSE step. This is the output from the 'DISPLAY USAGE' command.

```

-- 19     1000      999      99 4KB  ABOVE
-- 20     1000      393      39 4KB  BELOW
-- 21     1000      999      99 4KB  ABOVE
```

What is the value of Unused pages in the pageset your team is using?

Does it differ from the sample given (using pageset 20)? If so, what might be the reason?

How many stealable buffers remain in the bufferpool being used for this test after this job has run? (using bufferpool 20)

- 6) Return to the output list and select the SYSPRINT from the MGETQ step. This is the output step that reads the messages from the queue.

```
About to get 99999999 messages from:
  Qname  = TEAMXX.BBAR.QUEUE
  Qmgr   = QML3
Wait interval is 10 seconds
Quiet mode - Messages will not be printed
Buffer size is 1000 bytes
-----
Starting at 2014-03-26 02:42:08.611071
-----
Total Messages      : 300
Elapsed Time        : 0.008013 seconds
Message Rate        : 37439.11 msgs/sec
Average MQGET Time  : 0.033360 seconds
-----
Application CPU Time: 0.007600 seconds  (94.8%)
CPU per Message     : 0.0253 milliseconds
```

Make note of the following information from the test:

Total Messages: _____
Message Rate: _____
CPU per msg: _____

- 7) Return to the list of completed jobs, and expand the next one that ran. It should be the test for the above the bar bufferpool with no pageset I/O. Selecting the LOADQ SYSPRINT output the queue name should be TEAMXX.ABAR.QUEUE, where the XX is your team number.

- 8) Page down until the 'Total Transactions' thru 'Avg App CPU' is shown.

```
Total Transactions : 300
Elapsed Time      : 0.016 seconds
Application CPU Time: 0.012 seconds (76.4%)
Transaction Rate  : 19174.180 trans/sec
-----
Round trip per msg : 52 microseconds
Avg App CPU per msg : 39 microseconds
-----
```

Make note of the following information from the test:

Total Transactions: _____
Transaction Rate: _____
Round trip per msg: _____
Avg App CPU per msg: _____

- 9) Compare the numbers with those from the below the bar test. The sample test captured the following:

```
Total Transactions : 300
Elapsed Time      : 0.016 seconds
Application CPU Time: 0.012 seconds (76.8%)
Transaction Rate  : 19244.340 trans/sec
-----
Round trip per msg : 51 microseconds
Avg App CPU per msg : 39 microseconds
-----
```

Note that the difference observed by the OEMPUTX process is about 1 microsecond in the roundtrip time, and slightly lower transaction rate. The average CPU consumption was the same.

10) Return to the output list and select the SYSPRINT from the LOADUSE step. This is the output from the 'DISPLAY USAGE' command.

```

What is the value of Unused pages in the pageset your team is using?

Does it differ from the sample given (using pageset 21)? If so, what might be the reason?

Does the number of Unused pages in the job you ran differ from the below the bar test?

How many stealable buffers remain in the bufferpool being used for this test after this job has run? (using bufferpool 21)

Does the number of stealable buffers in the job you ran differ from the below the bar test?

- 11) Return to the output list and select the SYSPRINT from the MGETQ step. This is the output step that reads the messages from the queue.

```
About to get 99999999 messages from:
  Qname  = TEAMXX.ABAR.QUEUE
  Qmgr   = QML3
Wait interval is 10 seconds
Quiet mode - Messages will not be printed
Buffer size is 1000 bytes
-----
Starting at 2014-03-26 02:42:59.714637
-----
Total Messages      : 300
Elapsed Time        : 0.007851 seconds
Message Rate        : 38211.67 msgs/sec
Average MQGET Time  : 0.033360 seconds
-----
Application CPU Time: 0.007400 seconds  (94.3%)
CPU per Message     : 0.0247 milliseconds
```

Make note of the following information from the test:

Total Messages: _____
Message Rate: _____
CPU per msg: _____

12) Compare the MGET result with the below the bar results. The sample given was:

```
About to get 99999999 messages from:
  Qname  = TEAMXX.BBAR.QUEUE
  Qmgr   = QML3
Wait interval is 10 seconds
Quiet mode - Messages will not be printed
Buffer size is 1000 bytes
-----
Starting at 2014-03-26 02:42:08.611071

-----
Total Messages      : 300
Elapsed Time        : 0.008013 seconds
Message Rate        : 37439.11 msgs/sec
Average MQGET Time  : 0.033360 seconds
-----
Application CPU Time: 0.007600 seconds (94.8%)
CPU per Message     : 0.0253 milliseconds
```

How does the Message Rate vary from the below the bar test you ran:

And the CPU per msg rate?:_____

Interestingly enough, in the sample test the get process from the above the bar bufferpool the performance was actually better.

TECHTIP 8: Your mileage will vary – it is critical that customers test this for themselves in a production like environment.

- 13) Return to the list of run jobs and select the next one, below the bar with I/O.
- 14) Again, examine the output from the LOADQ step. The results from the sample test look as follows:

```

Total Transactions   : 1200
Elapsed Time        : 0.974 seconds
Application CPU Time: 0.050 seconds (5.1%)
Transaction Rate    : 1232.367 trans/sec
-----
Round trip per msg  : 811 microseconds
Avg App CPU per msg : 41 microseconds
    
```

In this test there should be I/O to the pageset. Compare the transaction rate, roundtrip and average CPU between this test and the below the bar BP with no I/O. In the samples the comparison would look as follows:

Test Type	Transaction Rate	Roundtrip	Average CPU
BP below, no IO	19.244.340	51	39
BP below, IO	1232.367	811	41

Were your results similar?

- 15) Return to the output list, and examine the display usage results following the LOADQ (called the LOADUSE) step. Were there differences in the usage shown for either pageset or bufferpool from the earlier tests?

- 16) Return to the output list and examine the MGETQ output. The sample output shows the following:

```

About to get 99999999 messages from:
  Qname  = TEAMXX.BBAR.QUEUE
  Qmgr   = QML3
Wait interval is 10 seconds
Quiet mode - Messages will not be printed
Buffer size is 1000 bytes
-----
Starting at 2014-03-26 02:44:56.799397

-----
Total Messages      : 1200
Elapsed Time        : 0.367602 seconds
Message Rate        : 3264.40 msgs/sec
Average MQGET Time  : 0.008640 seconds
-----
Application CPU Time: 0.052700 seconds  (14.3%)
CPU per Message     : 0.0439 milliseconds
  
```

Compare the message rate and CPU per message values. In the samples test, we observed the following:

Test Type	Transaction Rate	Average MQGET time	Average CPU
BP below, no IO	37439.11	.0076	.0253
BP below, IO	3264.40	.008640	.0439 milliseconds

TECHTIP 9: I/O can be expensive. The costs, both CPU and responsiveness, are very dependent on the underlying hardware and software that drives the I/O. I/O cannot be avoided on persistent messages, as those must be written to the logs, but it can be for non-persistent messages.

17) Return to the list of completed jobs, and expand the next one that ran. It should be the test for the above the bar bufferpool with pageset I/O. Selecting the LOADQ SYSPRINT output the queue name should be TEAMXX.ABAR.QUEUE, where the XX is your team number.

18) Page down until the ‘Total Transactions’ thru ‘Avg App CPU’ is shown.

```

Total Transactions   : 1200
Elapsed Time        : 0.972 seconds
Application CPU Time: 0.050 seconds (5.1%)
Transaction Rate    : 1234.466 trans/sec
-----
Round trip per msg  : 810 microseconds
Avg App CPU per msg : 41 microseconds
-----
    
```

Compare the rates between the above the bar wit and without I/O. The same tests showed the following.

Test Type	Transaction Rate	Roundtrip	Average CPU
BP above, no IO	19174.180	52	39
BP above, IO	1234.466	810	41

19) Return to the output list, and examine the display usage results following the LOADQ (called the LOADUSE) step. Were there differences in the usage shown for either pageset or bufferpool?

- 20) Return to the output list and examine the MGETQ output. The sample output shows the following:

```
About to get 99999999 messages from:
  Qname  = TEAMXX.ABAR.QUEUE
  Qmgr   = QML3
Wait interval is 10 seconds
Quiet mode - Messages will not be printed
Buffer size is 1000 bytes
-----
Starting at 2014-03-26 02:50:41.562665
-----
Total Messages      : 1200
Elapsed Time        : 0.354260 seconds
Message Rate        : 3387.34 msgs/sec
Average MQGET Time   : 0.008629 seconds
-----
Application CPU Time: 0.050400 seconds  (14.2%)
CPU per Message     : 0.0420 milliseconds
-----
```

Compare the message rate and CPU per message values. In the samples test, we observed the following:

Test Type	Transaction Rate	Average MQGET time	Average CPU
BP above, no IO	38211.67	.0074	.0247
BP above, IO	3387.34	.050400	.042 milliseconds

- 21)
22)
23)
24)

Conclusion

These simple tests illustrate that the runtime costs of using the WMQ V8 feature of buffers above the bar are not significantly higher than the buffers below the bar in a limited test environment. However, this may not always be the case. If there is not enough real memory to support the above the bar buffers, z/OS paging will occur if the buffer pages are not fixed. If the buffer pages are fixed, the memory requirements could impact other application performance.

Customers should evaluate the costs in their environment to avoid ‘surprises’.

Please also note we had hoped to present the new SMF bufferpool data, but the MP16 print program from the beta downloads is not formatting them as of the date this was written. That has been reported as a problem to the lab, and we hope to have a resolution soon.
