August 13, 2015  
Session 17414

#SHAREorg

SHARE is an independent volunteer-run information technology association  
that provides **education**, **professional networking** and **industry influence**.

# Trademarks

**The following are trademarks of the International Business Machines Corporation in the United States, other countries, or both.**

Not all common law marks used by IBM are listed on this page. Failure of a mark to appear does not mean that IBM does not use the mark nor does it mean that the product is not actively marketed or is not significant within its relevant market.

Those trademarks followed by ® are registered trademarks of IBM in the United States; all others are trademarks or common law marks of IBM in the United States.

For a complete list of IBM Trademarks, see [www.ibm.com/legal/copytrade.shtml](http://www.ibm.com/legal/copytrade.shtml):

\* AS/400®, e business(logo)®, DBE, ESCO, eServer, FICON, IBM®, IBM (logo)®, iSeries®, MVS, OS/390®, pSeries®, RS/6000®, S/30, VM/ESA®, VSE/ESA, WebSphere®, xSeries®, z/OS®, zSeries®, z/VM®, System i, System i5, System p, System p5, System x, System z, System z9®, BladeCenter®

**The following are trademarks or registered trademarks of other companies.**

Adobe, the Adobe logo, PostScript, and the PostScript logo are either registered trademarks or trademarks of Adobe Systems Incorporated in the United States, and/or other countries.

BMC Mainview AutoOPERATOR is a trademark of the BMC Software Corporation

CA Ops/MVS is a trademark of the CA Technologies corporation.

Java and all Java-based trademarks are trademarks of Sun Microsystems, Inc. in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

Intel, Intel logo, Intel Inside, Intel Inside logo, Intel Centrino, Intel Centrino logo, Celeron, Intel Xeon, Intel SpeedStep, Itanium, and Pentium are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

ITIL is a registered trademark, and a registered community trademark of the Office of Government Commerce, and is registered in the U.S. Patent and Trademark Office.

IT Infrastructure Library is a registered trademark of the Central Computer and Telecommunications Agency, which is now part of the Office of Government Commerce.

zCostManagement is a trademark of the zCostManagement Corporation.

zPrice Manager is a trademark of the zIT Consulting Corporation

\* All other products may be trademarks or registered trademarks of their respective companies.

#### Notes:

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed.

Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

IBM hardware products are manufactured from new parts, or new and serviceable used parts. Regardless, our warranty terms apply.

All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.

This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.

All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Notice Regarding Specialty Engines (e.g., zIIPs, zAAPs and IFLs):

Any information contained in this document regarding Specialty Engines ("SEs") and SE eligible workloads provides only general descriptions of the types and portions of workloads that are eligible for execution on Specialty Engines (e.g., zIIPs, zAAPs, and IFLs). IBM authorizes customers to use IBM SE only to execute the processing of Eligible Workloads of specific Programs expressly authorized by IBM as specified in the "Authorized Use Table for IBM Machines" provided at

[www.ibm.com/systems/support/machine\\_warranties/machine\\_code/aut.html](http://www.ibm.com/systems/support/machine_warranties/machine_code/aut.html) ("AUT").

No other workload processing is authorized for execution on an SE.

IBM offers SEs at a lower price than General Processors/Central Processors because customers are authorized to use SEs only to process certain types and/or amounts of workloads as specified by IBM in the AUT.

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Agenda

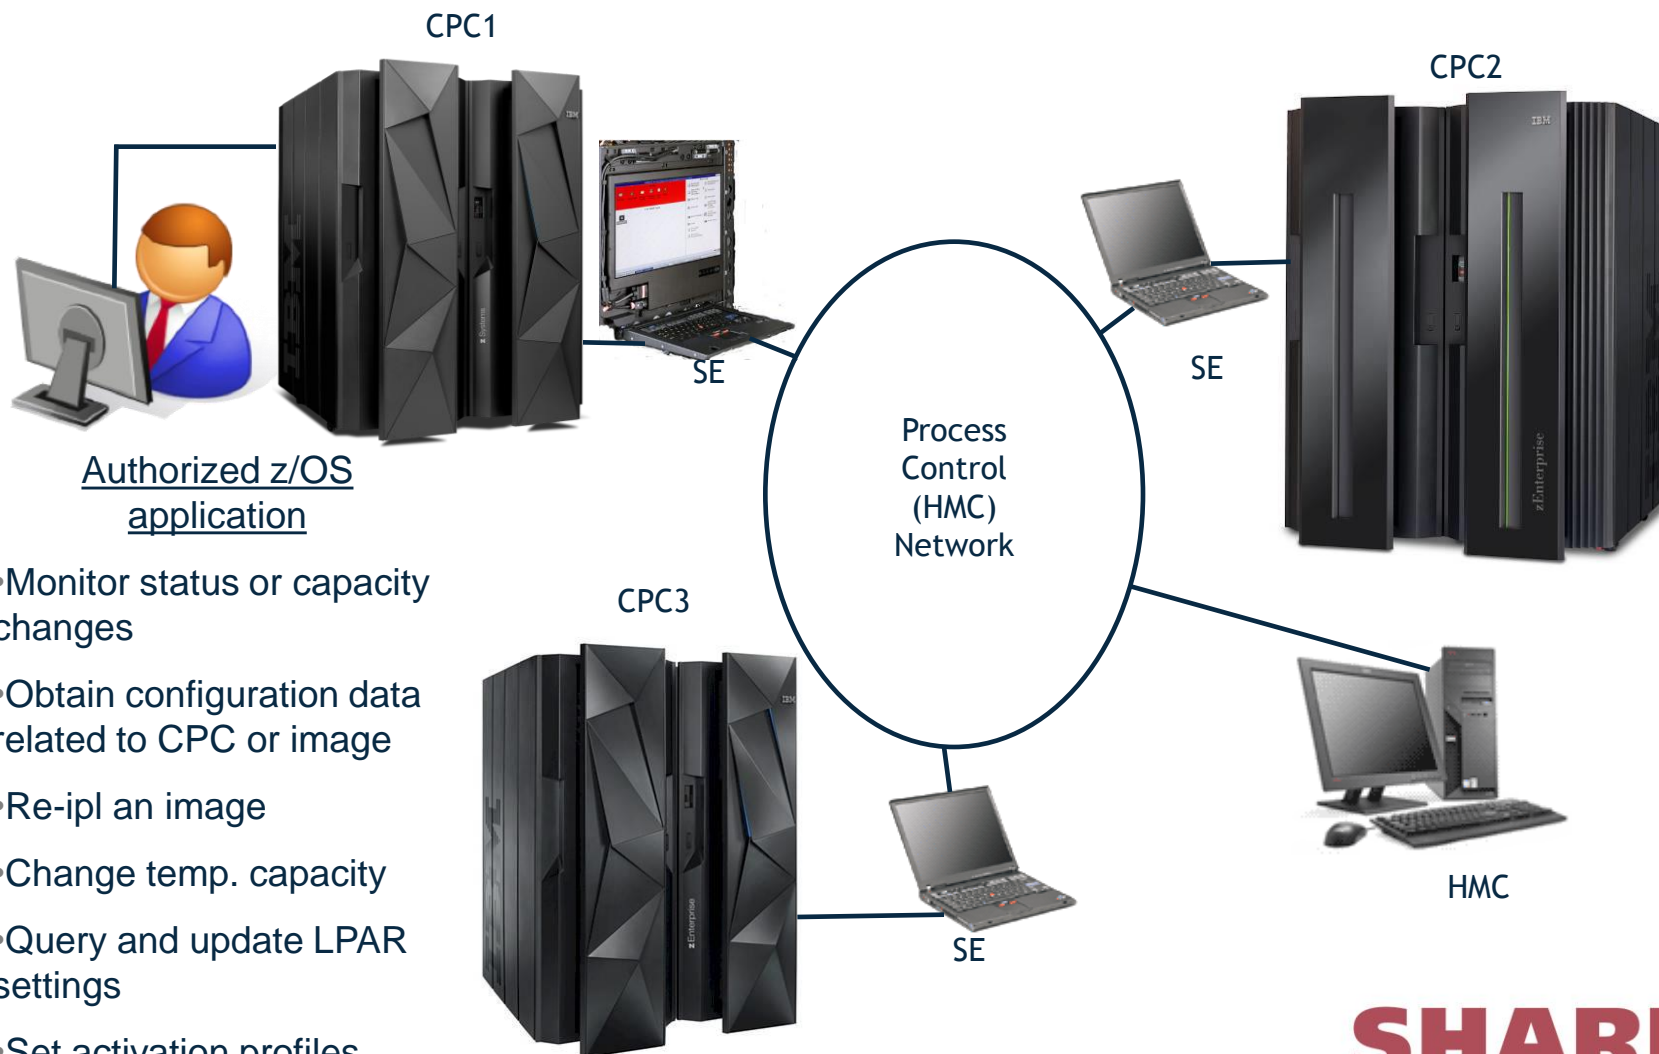

- Quick BCPii Overview
  - What is it and what can I do with it?
  - Installation basics
- What can I do with BCPii?
  - Off the shelf solution examples
    - IBM offerings
    - Non-IBM offerings
  - Writing my own BCPii app
    - Typical BCPii usage when writing your own application
    - Programming basics
- BCPii V2R2 Update
- Reference material

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Quick BCPii Overview

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Overview - What is BCPii?

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Overview - What is BCPii?

- **B**ase **C**ontrol **P**rogram **i**nternal **i**nterface
  - Allows authorized z/OS applications to have HMC-like control over systems in the process control (HMC) network
  - A set of authorized APIs provided
- Does not use any external network
  - Communicates directly with the SE rather than going over an IP network
- A z/OS address space that manages authorized interaction with the interconnected hardware

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Installation Basics

- Starting with z/OS 1.11, system automatically tries to start BCPii address space at IPL time.
  - You don't need to add anything to COMMNDxx or automation.
- Successful start requires that certain steps have been carried out:
  - Setup on the HMC/SE:
    - Enable Cross Partition Authority for every LPAR that you want to be able to issue or be the target of BCPii commands.
    - Enable SNMP and define the Community Name.
      - Both of these can be changed non-disruptively if you wish
  - Setup in z/OS
  - Setup with SAF Security authorizations (in z/OS)

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Setup on the SE/HMC – Part 1

Change Logical Partition Security - SCZP301

Buttons: Save and Change, Change Running System, Save to Profiles, Reset, Cancel, Help

Remember that this must be done for every LPAR that will exploit BCPii

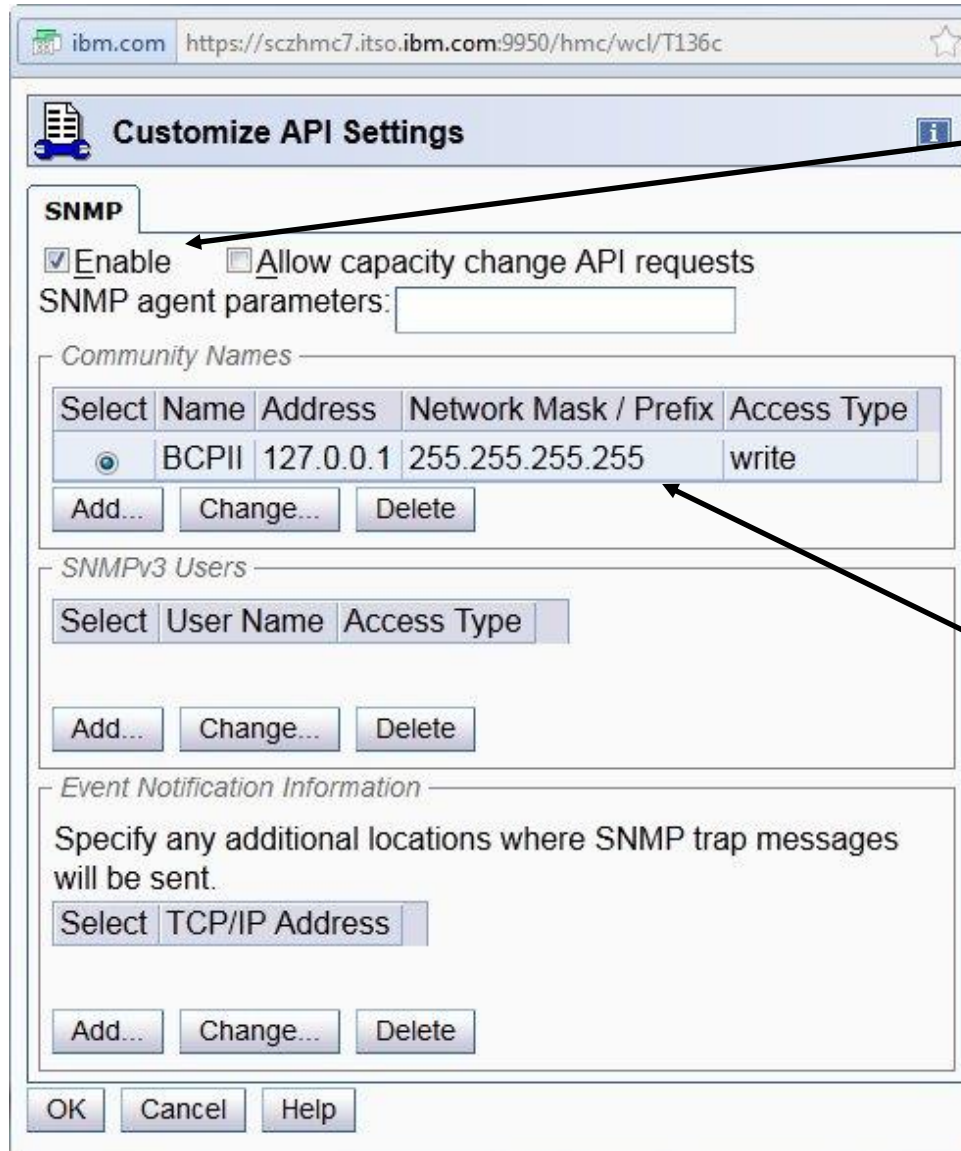

Enable "Cross Partition Authority"

Select Save and Change

This should update activation profiles and implement change on active LPAR

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Setup on the SE/HMC – Part 2

**Customize API Settings**

**SNMP**

☒ Enable ☐ Allow capacity change API requests

SNMP agent parameters:

Community Names

Select	Name	Address	Network Mask / Prefix	Access Type
<input checked="" type="radio"/>	BCPii	127.0.0.1	255.255.255.255	write

Add... Change... Delete

SNMPv3 Users

Select	User Name	Access Type
--------	-----------	-------------

Add... Change... Delete

Event Notification Information

Specify any additional locations where SNMP trap messages will be sent.

Select TCP/IP Address

Add... Change... Delete

OK Cancel Help

Enable "SNMP APIs"

Add a "community name" associated with BCPii's "port" into the SE

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Setting up BCPii in z/OS

- BCPii address space requirements
  - hlq.SCEERUN and hlq.SCEERUN2 data sets must be in LNKLIST.

# Setting up BCPii Security definitions

- General BCPii authority for applications
  - The profile HWI.APPLNAME.HWISERV in the FACILITY resource class controls which applications can use BCPii services.
    - Anyone wishing to use BCPii must at least have READ access to this profile.
  - The FACILITY class must be RACLISTed.

# Setting up BCPii Security definitions

A BCPii application needs to have authority to the particular resource (CPC, Image, Capacity Record, Activation Profile) that it is trying to access (This is IN ADDITION to having access to the HWISERV FACILITY profile).

Profile names are:

- CPC: HWI.TARGET.netid.nau
- Image: HWI.TARGET.netid.nau.imagename
- Capacity Record: HWI.CAPREC.netid.nau.caprec
- Activation Profile: HWI.TARGET.netid.nau

Note: netid.nau is the 3-17 character SNA name for CPC (defined when you first define the SE to the HMC)

# Setting up BCPii Security Definitions

- Choose SAF authority to a specific resource listed above to allow BCPii service access:
  - HWILIST, HWICONN, HWIDISC, HWIEVENT, HWIQUERY
    - At least **READ** access
  - HWISET
    - At least **UPDATE** access
  - HWICMD
    - At least **CONTROL** access

# Setting up BCPii Security Definitions – Associate CPC definition with community name

- When defining the CPC profiles, APPLDATA must match the community name you specified on the SE:
  - `RDEFINE FACILITY HWI.TARGET.USIBMSC.SCZP301 UACC(NONE) APPLDATA('BCPII')`

# The BCPii address space

- **System automatically tries to start BCPii address space at every IPL:**
  - Address space name is HWIBCPii.
  - Address space shows up in SDSF DA, but not in D A,L output.
- **Address space can be stopped using P HWIBCPii command:**
  - Once the address space is stopped, no BCPii calls will be processed.
  - ENF signal is broadcast to let any interested parties know that the interface is stopping.
  - If P command doesn't work, you can use a CANCEL HWIBCPii
- **Address space can be started again using S HWISTART (HWISTART is delivered in SYS1.PROCLIB)**

# How to check the status of BCPii

- There is currently no console command to check the status of BCPii.
- If Pre-reqs are not in place at IPL time, address space will start and then stop.
- So, if address space is active, that is at least a positive sign.
  - Check for message HWI001I BCPii IS ACTIVE among IPL messages
  - Doesn't guarantee that every CPC has been set up to support BCPii
  - Currently the only way to check is from a program that uses the BCPii API
    - If program doesn't get 'F00'X return code (HWI\_NOT\_AVAILABLE), BCPii is active on the system.

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Start BCPii

Having completed the setup work on the local CPC and in RACF, we now start BCPii address space:

# What can I do with BCPii?

## Off the shelf solutions

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# What can I do with BCPii?

- Sampling of IBM products/features using z/OS BCPii:
  - **Parallel Sysplex** (System Status Detect Partitioning Protocol)– V1R11 and higher
  - **Capacity Provisioning Manager (CPM)** – V1R10 and higher
  - **Hardware Configuration Definition (HCD)** – V1R13 and higher
  - **Multi-Site Workload Lifeline**

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Why BCPii and SSDPP

- If a member of a sysplex dies, it is probably holding resources that will be required by other members of the sysplex.
- The longer this situation lasts, the more units of work will be impacted.
- The goal is to partition a dead system as quickly out of the sysplex as possible

# Why BCPii and SSDPP?

**Prior to z/OS 1.11, the only mechanism that z/OS had to determine the status of another member of the sysplex was to check that system's heartbeat in the sysplex CDS.**

- If a system is going through recovery, it might not be able to update its heartbeat in the CDS. This means that you need to give a system some "reasonable" amount of time to recover before the system partitions the sick system out of the sysplex.
- An IPL might take 30 minutes. Would you rather give a little more time for recovery to work, or kill it now and face an IPL? Your answer is probably "it depends on whether the system is dead or is in the middle of recovery".
- Prior to z/OS 1.11, z/OS had no way to know whether another system was dead or trying to recover.
- SSDPP (and BCPii) changed that.

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Before and after SSD (and BCPii)

- Before:
  - Wait until the Failure Detection Interval (FDI) occurs before partitioning the system out of the plex.
  - A system that wait states takes roughly just under 3 minutes before Sysplex Failure Manager (SFM) detects the problem
  - “Sympathy sickness” abounds on all systems in the sysplex for all of this time

# Before and after SSD (and BCPii)

- New way:
  - Use BCPii whenever a heartbeat is missed to detect the status of the other system
  - If system is dead, SysReset that image and partition it out of the sysplex immediately
  - Systems not dead experience on average more than 2.5 minutes of relief from sympathy sickness
  - “Reply Down” message becomes mostly obsolete, reducing human error to this WTOR prompt
  - AutoIPL can be used in conjunction with this function to bring back the dead system

# System Status Detection Partitioning Protocol

- **Summary:**
  - Prereqs:
    - Correctly formatted Sysplex CDS
    - Implement BCPii
  - System Status Detection Partitioning Protocol is a significant step forward. This is the most fundamental change to handling of system failures since the introduction of SFM.
  - Easy to implement.
  - You can start to enable it immediately - no need to wait for the whole sysplex to be upgraded.

# Capacity Provisioning Manager

- Today's challenges to manage capacity
  - Unexpected events and workload spikes can afford higher processing capacity
  - Manual capacity management can be time-consuming and error prone
  - Capacity provisioning decisions must be made without sound data

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Manual capacity upgrades – How it could look like

1.	Workload increases	0 min
2.	Operator realizes bottleneck	5-10 min
3.	Operator informs system programmers and manager	2 min
4.	Discussion	10 min
5.	Logon to HMC, change capacity	5 min

***... meanwhile, so much workload may have queued up that a small amount of additional capacity would be insufficient to decrease the queued workload***

***→ Much more capacity has to be added***

***CPM can react faster and reduce cost***

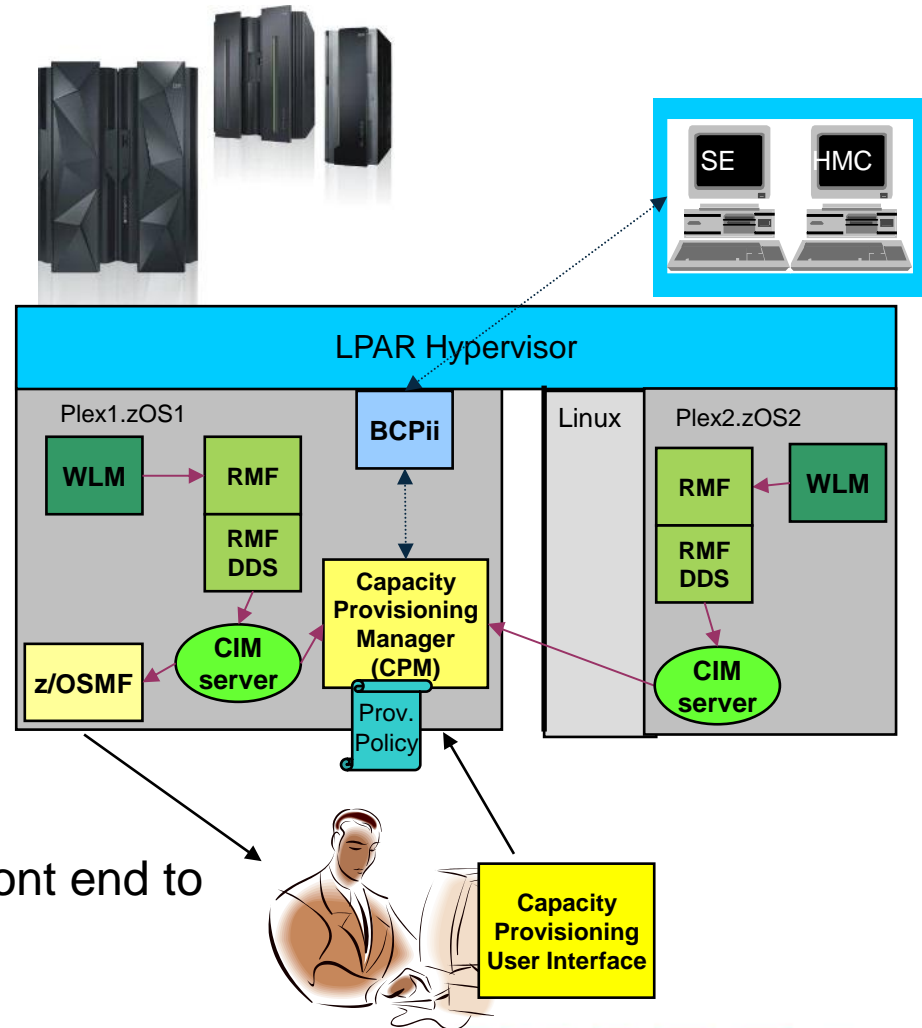

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Capacity Provisioning – Infrastructure in a Nutshell

- z/OS WLM manages workloads to goals and business importance
- WLM indicators available through monitoring component
  - E.g. z/OS Resource Measurement Facility (RMF)
  - One RMF gatherer per z/OS system
  - RMF Distributed Data Server (DDS) per Sysplex
- Capacity Provisioning Manager (CPM) retrieves critical metrics through CIM
- CPM communicates to support elements or HMC, via BCPii.
- Capacity Provisioning User Interface is front end to administer Capacity Provisioning policies
  - z/OSMF Capacity Provisioning task

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# CPM Policies and Processing Parameters

- CPM server uses three types of input:
  - **Domain configuration** defines the topology and connections, such as the CPCs and z/OS systems that are to be managed by the server
  - **Policy** contains the information as to
    - which work is provisioning eligible,  
under which conditions and during which timeframes
    - how much capacity may be activated when the work suffers due to insufficient processing capacity
  - **PARM** data set contains setup instructions such as UNIX environment variables, and various processing options that may be set by an installation.

- When that work does not achieve its goal due to insufficient capacity and additional capacity would help, and
- The performance index of service class periods exceeds the activation threshold for a specified duration
  - Work is considered to require help and additional capacity is temporarily added using purchased capacity records
- Sophisticated controls can scope on processor limits, defined capacity limits, and group capacity limits
- Audit trails

- HCD contains a new **S/390 Microprocessor Cluster List**, to display all logical partitions belong to the current CPC.
  - Useful information can be displayed such as:
    - Sysplex name the partition belongs
    - Name of the system running in the displayed partition
    - Operating system type
    - Operating system release level

# IBM Multi-site Workload Lifeline

- Enables intelligent load balancing of TCP/IP workloads across two sites at unlimited distances to provide nearly continuous availability.
- Enables movement of workloads from one site to another by providing graceful rerouting.
- Lifeline uses BCPii to detect site failures. Lifeline communicates with all CPCs on the HMC network across both sites, to determine whether the LPARs that make up the z/OS sysplexes within each site are available. If all LPARs within a site are no longer active, then Lifeline can trigger site failure processing.
- A key component of the GDPS/Active-Active solution.

# What can I do with BCPii?

- Non-IBM offerings example:
  - CA Technologies
    - CA OPS/MVS® Hardware Services utilizes BCPii to automate hardware functions such as:
      - listening for hardware events based on coding simple rules.
        - Event data is made available as simple rule variables.
      - issuing directives to the hardware easily
        - GETATTR, SETATTR and SENDCMD to specific CPC, LPAR or Activation profile entities
        - Example: can set CPU weights, CBU, COD, etc..

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# What can I do with BCPii?

- Non-IBM offerings example:
  - BMC Software
    - Mainview AutoOPERATOR® REXX execs utilize BCPii to List, Query, Set and issue commands to targeted hardware entities
    - “The IMFEXEC HMC capability may be interwoven with the existing automation to improve system throughput/reliability or reduce financial costs (eg. MSU based IBM charges).”
    - Examples of use: Querying and altering the GroupProfileCapacity, Changing the number of processors in an LPAR, etc..

# What can I do with BCPii?

- Non-IBM offerings examples:
  - zPrice Manager®
    - Every 5 minutes zPrice Manager will compare the actual MSU usage, the 4hr MSU usage, and other parameters against rules, act accordingly and offload the information for reporting purposes. zPrice Manager accesses HMC through the BCPii interface.
      - Changes weighting, defined capacity and capacity groups based on user specified rules
  - zDynaCap® is another product from same company that also uses BCPii.

# What can I do with BCPii?

- Non-IBM offerings example:
  - zCost Management AutoSoftCapping®
    - Optimizes the performance of your system while controlling your Workload License Charges.
      - Dynamically load balances between the LPARS
      - Controlled total defined capacity
      - Web reporting
      - Forces better compliance with SLAs at the lowest cost

# What can I do with BCPii?

## Writing my own BCPii app

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Typical BCPii usage when writing your own application

- Application to change LPAR weights at strategic times to push thru critical work
- Application to change LPAR weights to meet SLAs or to reduce costs
- Application to synchronize primary sysplex with disaster recovery site
- Remote data center operations
- React to hardware messages on the CPC
- Remote student partition administration

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Programming Basics

- Services available in any address space
  - Program-authorized, and
  - SAF-authorized
- Multiple languages supported
  - C
  - Assembler
  - REXX \*NEW in z/OS V2R1\*
- z/OS UNIX callers can receive event notifications thru z/OS UNIX-only services utilizing the Common Event Adapter (CEA)

- Interface Definition Files (IDF, or include files) provided by BCPii:
  - C (*provided in SYS1.SIEAHDRV.H*)
    - HWICIC – Main BCPii include file
    - HWIZHAPI – Additional constant definitions include file
  - Assembler (*provided in SYS1.MACLIB*)
    - HWICIASM – Main BCPii include file
    - HWIC2ASM – Additional constant definitions include file
  - REXX (*provided in SYS1.MACLIB*) \*NEW\*
    - HWICIREX – Main BCPii include file
    - HWIC2REX – Additional constant definitions include file

# Programming Basics

## – Samples (Non-REXX)

- BCPii sample programs (*provided in samplib*):
  - C sample written in Metal C:
    - HWIXMCS1 provides an example of how to use all of the traditional BCPii APIs and how to construct a simple BCPii application.
    - HWIXMCX1 provides a simple example of how a BCPii Event Notification Facility (ENF) exit could be coded to field various BCPii-registered events.

# Programming Basics – REXX Support

- **BCPii is providing a new REXX host command environment for System REXX, TSO REXX and ISV REXX environments. (address bcpii)**
  - Same authorization requirements as current BCPii applications
  - Simpler programming model than in C or Assembler
    - Programming style is intuitive for REXX programmer
    - Use of stem variables for variable number of items output
  - Parameter lists for BCPii services using REXX are simpler than C or Assembler parameter lists
    - Differences documented in the publications
  - BCPii REXX programs compatible with the different REXX environments\*
  - Built-in RC return will indicate if BCPii processed the host command successfully. If zero, the BCPii return code should be consulted.

\* For the common services supported by BCPii in the different environments

- BCPii services available
  - **HWILIST** (BCPii List)
  - **HWICONN** (BCPii Connect)
  - **HWIDISC** (BCPii Disconnect)
  - **HWIQUERY** (BCPii Query)
  - **HWISET** (BCPii Set)
  - **HWICMD** (BCPii Command)
  - **HWIEVENT** (BCPii Event (for non-z/OS Unix callers))
  - **HwiBeginEventDelivery, HwiEndEventDelivery, HwiManageEvents, HwiGetEvent** (for z/OS Unix callers)

# Programming Basics

- **HWILIST** - Retrieve HMC and BCPii configuration-related information
  - List CPCS
    - List the CPCs interconnected with the local CPC
  - List Images
    - List the images (LPARs) contained on an individual CPC or in user-defined imagegrp
  - List Capacity Records
    - List the capacity records contained on an individual CPC
  - List Events
    - List the events already registered on a particular BCPii connection
  - List Local CPC, List Local Image
    - Obtain the name of the CPC name or image (LPAR) name that the BCPii application is currently running on.
  - List Reset Activation Profiles, List Image A.P. and List Load A.P.
    - List the currently defined activation profiles contained on a individual CPC
  - List User-defined Image Group Names
    - List the currently defined image group names contained on an individual CPC.

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Programming Basics

- **HWICONN** - Establish a logical connection between the application and a:
  - Central processor complex (CPC),
  - CPC image (LPAR) on a particular CPC,
  - Capacity record on particular CPC
  - Activation Profiles
  - User-defined image groups
- **Input:**
  - Connection type (above 3 types)
  - Connection name (CPC example: net1.cpc01)
  - Previous ConnectToken (if type is image, caprec, activation profile, or user-defined image group)
- **Output:**
  - ConnectToken used on subsequent BCPii calls.

# Programming Basics

- **HWIDISC** – Release a logical connection no longer needed
- Input:
  - ConnectToken
- How are connections implicitly disconnected?
  - C, Assembler, System REXX
    - When a job completes associated with the BCPii application (JES or z/OS UNIX initiator), when the address space has terminated, or when the address space that invoked the System REXX exec has terminated.
  - TSO/E REXX, ISV-provided REXX environment
    - When the REXX exec ends

# Programming Basics

- **HWIQUERY** - Retrieve information about objects managed by the hardware management console (HMC)/support element related to:
  - Central processor complexes (CPCs),
  - CPC images (LPARs) on a particular CPC,
  - Capacity records on particular CPC
  - Activation Profiles (Reset, Image, or Load)
  - User-defined Image group properties
- **Input:**
  - ConnectToken (associated with one of the above)
  - List of attributes requested, data areas to store the return values)
- **Output:**
  - Data returned

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Programming Basics

- Examples of information you can query
  - CPC information
    - General information
      - **Name, serial, machine type, id, networking info, level of SE, engineer code & microcode levels installed**
    - Status information
      - **Operating status and other status values**
    - Capacity information
      - **Various CBU info, Capacity on Demand info, Processor configuration, including IFA, IFL, ICF, IIP**
    - Power savings information
      - **Is power savings available?, current power savings mode, supported power saving modes available**
  - Image information
    - General information
      - **Name, OS info**
    - Capacity information
      - **Defined capacity, Processor weights**

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Programming Basics

- Examples of information you can query (continued):
  - Capacity record information
    - General information
      - **Name, Activation and expiration dates, activation days**
    - Status information
      - **Record status**
    - Capacity information
      - **The entire Capacity record**
  - Activation profile information
    - Most activation profiles values

# Programming Basics

- **HWISET**– Change or set data for objects managed by the hardware management console (HMC)/support element related to:
  - Central processor complexes (CPCs),
  - CPC images (LPARs) on a particular CPC,
  - Activation Profiles
- **Input:**
  - ConnectToken (associated with one of the above)
  - Attribute (object) to modify, the modified value, the value length
- **Output**
  - Return code

# Programming Basics

- Examples of information you can set
  - CPC information
    - Acceptable status values
    - Next Reset activation profile name
    - Processor Running Time
  - Image information
    - Various processor weights
  - Activation Profile Information
    - Most activation profile values

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

- **HWICMD** – Direct hardware/software commands to CPCs, images and user-defined image groups
- Input:
  - ConnectToken (associated with a CPC, image, or image group)
  - Command parameter structure (based on the type of command issued)
- Output
  - Synchronous return code
  - Asynchronous command completion event delivered to previously-registered event user when command finishes.
    - **For image commands targeted to an image group, one image event is returned for each image in the user-defined image group.**

# Programming Basics

- Examples of commands that can be issued:
  - CPC commands
    - Activate, Deactivate an entire CPC
    - CBU request
      - **Activate or Undo**
    - On/Off Capacity on Demand request
      - **Activate or Undo**
    - Switch Power Savings Mode
    - Sysplex Timer (STP) commands
  - Image commands
    - SysReset, SysReset with IPL Token
    - Load
    - Start, Stop all CPs
    - Add or remove temporary capacity
    - Issue operating system command

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

- **HWIEVENT (non-z/OS Unix callers)** – Register/Un-register an application and its connection to be notified for hardware and software events occurring on the connected CPC or image.
- Input:
  - ConnectToken (associated with a CPC or image)
  - Event action (Add or Delete)
  - Events for which an application wants to be notified
  - ENF exit to receive control when event arrives
- BCPii registers the user with ENF for this event(s) such that the ENF exit is driven only when the CPC and/or image name of the connector matches.

# Programming Basics

- Examples of events that can be listened to:
  - Command completions
  - Status changes
  - Capacity changes
  - Disabled waits
  - Power mode changes
  - BCPii status changes and communication errors

# Programming Basics

## More on z/OS BCPii REXX

- z/OS BCPii APIs supported in REXX:

Services	System REXX	TSO REXX	ISV REXX
HWICONN	X	X	X
HWIDISC	X	X	X
HWILIST	X	X	X
HWIQUERY	X	X	X
HWISET	X	X	X
HWIEVENT	X		
HWICMD	X		

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Programming Basics

- **z/OS BCPii System REXX support**
  - Full support of BCPii API suite
    - Command and event require non-REXX event exit and a program to wait on an ECB based on event activity
  - Ability for REXX BCPii applications to work with other C or Assembler BCPii applications
    - The Connect Token can be passed to and from the REXX exec and the other compiled BCPii applications.
  - Connections have address space affinity
    - When AXREXX macro invoker's address space terminates, BCPii will implicitly disconnect all connections
  - TSO=YES and TSO=NO environments supported
    - TSO=YES allows REXX to interpret the IBM-supplied REXX include file
    - TSO=NO requires the IBM-supplied include file to be copied into the exec
  - TIMELIMIT keyword can be used to throttle BCPii exec execution time
    - The default 30 seconds value may need to be adjusted

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

- **z/OS BCPii System REXX support (*continued*):**
  - Two methods of execution of BCPii REXX execs
    - Code an assembler program to invoke the AXREXX macro
      - Specify the name of BCPii REXX exec and any of the myriad of AXREXX options
    - New BCPii helper program HWIREXX
      - IBM-supplied helper program shipped in SYS1.LINKLIB that authorized users can invoke to launch their System REXX execs
      - Simple REXX execs can be invoked directly without the need to code the AXREXX assembler macro
      - A set of input parameters allows minor customization
        - Samplib JCL member HWIXMRJL provides list of parameters HWIREXX takes as input (supports a subset of AXREXX options)

- **z/OS BCPii TSO REXX Support**
  - Support of all BCPii APIs except HWIEVENT and HWICMD
  - Connections have task affinity
    - All connections created by the REXX exec are automatically cleaned-up by BCPii when exec completes
    - Connections cannot be shared with other BCPii applications or REXX execs
  - Same SAF authorization requirements as other BCPii applications
  - Setup required for TSO REXX support
    - IKJTSOxx parmlib member must have the following update:
      - AUTHTSF NAMES (HWIC1TRX)

- **z/OS BCPii ISV REXX Support**
  - Support of all BCPii APIs except HWIEVENT and HWICMD
  - Connections have task affinity
    - All connections created by the REXX exec are automatically cleaned-up by BCPii when exec completes
    - Connections cannot be shared with other BCPii applications or REXX execs
  - Same program and SAF authorization requirements as other BCPii applications
    - Must be invoked from an authorized address space
  - To get the “bcpii” host command environment, the REXX exec must issue the following statement:
    - `rc = hwihost("ON")`

# Programming Basics

## Example of z/OS BCPii REXX exec in action:

```
ListType = HWI_LIST_CPCS
address bcpii "hwilist
              ReturnCode
              ConnectToken
              ListType
              CPCList.
              DiagArea."

If rc <> 0 | ReturnCode <> 0 Then
  /* Error handling code here */
Else
  Do
    Say 'Number of CPCs returned = ' CPCList.0
    /* Write the list of CPCs returned. */
    Do i = 1 to CPCList.0
      say 'CPC '|| i ' = ' CPCList.i
    End
  End
End
```

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# Programming Basics

- BCPii sample programs (*provided in samplib*):
  - REXX samples:
    - HWIXMRS1 provides a sample of how to use the connect, disconnect, list, query and set APIs in a similar format as HWIXMCS1.
    - HWIXMRS2 provide examples of using HWIEVENT and HWICMD in the System REXX environment. Assembler helper program HWIXMRA1 is required in order to run the REXX sample.
      - Sets up common storage accessible to both ENF Exit and waiting program.
      - Provides example of using the AXREXX macro to invoke the BCPii REXX exec
    - HWIXMRJL provides sample JCL to run a simple BCPii REXX under System REXX without having to code an Assembler program

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# What's New with z/OS BCPii in V2R2

Complete your session evaluations online at [www.SHARE.org/Orlando-Eval](http://www.SHARE.org/Orlando-Eval)

# The need for SMF support in z/OS BCPii

## ■ Problem Statement / Need Addressed

- Whenever a BCPii application issues an API that modifies hardware resources, there are not sufficient audit trails to keep track of which application/user modified the resources (SHARE Top 50 requirement SSMVSE12018)

## ■ Solution

- BCPii now cuts SMF 106 records for successful HWISET and HWICMD API calls

## ■ Benefit / Value

- Sufficient audit information to know what resources were modified by BCPii applications

# BCPii SMF support – How to cut the records

- New SMF 106 record
  - IEASYSxx points to SMFPRMxx member
  - SMFPRMxx member
    - SYS(TYPE(106))
- 2 subtypes
  - Subtype 1 (HWISET) SYS(TYPE(106(1)))
    - Cuts detailed information about each successful HWISET call
  - Subtype 2 (HWICMD) SYS(TYPE(106(2)))
    - Cuts detailed information about each successful HWICMD call

# BCPii SMF support – How to read the records

- Mapped by BCPii SMF Type 106 mapping macro
  - **SYS1.MACLIB(HWISMF6A)**
- Supplied sample formatting JCL
  - **HWI6AFMT**
    - Copies BCPii SMF Type 106 records from a data set or logstream to a temporary dataset
    - Using the DFSORT-provided ICETOOL:
      - Sorts the type 106, subtype 1 and subtype 2 records
      - Produces a summary report for the type 106 records
      - Produces a detailed report for type 106 for subtype 1 and subtype 2
  - **HWIRPTMP**
    - SMF type 106 JCL variable map as input to the DFSORT-provided ICETOOL

# What is actually in the SMF Data

- What is actually cut by BCPii in the SMF Record Type 106?
  - Connection Type of the HWISET or HWICMD request
    - CPC, Image, Reset activation profile, Image activation profile, or Load activation profile
  - CPC Name
  - Request parameter
    - Either the image name or activation profile name specified by the requester
  - ASID
  - Job name
  - User ID

# What specifically is in SMF records for HWISET?

- Detailed information in Subtype 1 (HWISET):
  - **SetType**
    - Resource that was modified
  - **Set Type Value Length**
    - Length of the value being set
  - **Set Parameter**
    - The actual value being set

# What specifically is in SMF records for HWICMD?

- Detailed information in Subtype 2 (HWICMD):
  - **Command Type**
    - Command that was issued
  - **Command parameter list passed to BCPii**
  - **Optional XML data sent on request**

# Example output

- Sample report output:

**SUBTYPE 1 RECORDS SUMMARY REPORT**      02/03/15      10:18:52

14	1	23DE0410	5C	<add><recordid>0

# Enabling BCPii SMF recording

- To activate BCPii SMF recording:
  - Parmlib method
    - Add the necessary statements to the SMFPRMxx parmlib member for SMF Type 106
      - SYS(TYPE(106))
      - SYS(TYPE(106(1)))
      - SYS(TYPE(106(2)))
      - SYS(TYPE(106(1:2)))
    - Issue the SET SMF=xx command to activate the parmlib changes
  - On the fly method
    - SETSMF command

# BCPii Reference Materials

- **z/OS 2.2 MVS Programming: Callable Services for High-Level Languages**
  - Primary BCPii documentation including installation instructions and BCPii API documentation (including BCPii REXX support)
- **z/OS 2.2 MVS System Commands:**

# Quick and Easy: BCPii!

BY STEVE WARREN AND RITA BEISEL

**I**t's time to check out the Base Control Program internal interface (BCPii) in z/OS Version 2 Release 1 (V2R1). The improvements in BCPii function might be the quick and easy recipe to help you start using this base function of the z/OS operating system. If you are already using BCPii, you can now use it more efficiently than ever.

## BCPii at your service

In z/OS V2R1, BCPii supports applications written in the REXX programming language, known for its ease of use. BCPii also minimized the traffic to the support element (SE). Less traffic to the SE might equal improved performance for you. Let's first take a step back and look at BCPii.

BCPii is a cool way to access System z hardware controls from any z/OS authorized application running in any address space. For example, you might want to:

- Find out what is going on with the hardware
- Perform powerful tasks like re-IPL or load an LPAR
- Receive notification when certain hardware events occur.

Do you want to do all these things from the convenience of your z/OS application? If so, BCPii is at your service! It's not necessary to install a suite of products or complete a complicated install process to start using it.

## Ready for REXX?

Before z/OS V2R1, the BCPii APIs supported applications using either the C or assembler programming languages. Over the years, there has been a growing and vocal demand for REXX programming language support in BCPii API.

## We listened and delivered

In z/OS V2R1, the BCPii support for REXX and a much simpler programming model than either the C or assembler programming languages, you can get applications up and running quickly and easily.

BCPii APIs support applications using REXX in the z/OS System REXX, TSO/E REXX, and independent software vendor (ISV) provided REXX programming environments. Not only does writing with the REXX programming language allow you to develop BCPii applications in record time, but also maintains your investment in your existing BCPii applications

written in C or assembler. These REXX applications can work right along side them.

## Sample BCPii REXX exec

Here is a simple BCPii REXX exec that lists all the interconnected processors in your Hardware Management Console (HMC) network.

Notice the intuitive programming style. Just specify the list type and voila, BCPii returns the data in a stem variable. The zero element of the stem variable contains the number of items returned and the 1 to n elements contain the actual names of the processors connected to the system. This is only an example, but the other BCPii API calls are just as intuitive and easy to use.

```
LISTTYPE = HWI_LIST_CPCS
ADDRESS BCPii "HWI LIST
RETURN CODE
CONNECT CODE
LIST TYPE
CPC LIST.
DIAG AREA."

IF RC <> 0 | RETURN CODE <> 0 THEN
/* IF THE REXX RC IS NOT GOOD OR THE BCPii RETURN
CODE IS NOT GOOD, HAVE ERROR HANDLING CODE HERE */
ELSE
DO
SAY 'NUMBER OF CPCS RETURNED = ' CPC LIST.0
/* WRITE THE LIST OF CPCS RETURNED. THE .0
ELEMENT CONTAINS THE NUMBER OF ITEMS RETURNED */
DO I = 1 TO CPC LIST.0
SAY 'CPC ' || I ' = ' CPC LIST.I
END
END
```

Figure 1. Sample BCPii REXX exec

### BCPii and REXX: Walking arm in arm

Caroline Exum | Aug 5 | Tags: [bcp](#) [zenterprise](#) [systemz](#) [z/os](#) [rebecca\\_horner](#) [zos](#) [z](#) [system](#) | 183 Visits

By Rebecca Horner, z/OS BCPii Developer

Remember those friends who would say to you, "Oh, you should meet my friend, Sam. You'd be a perfect match." Well, BCPii and REXX have finally met, and now they're inseparable.

As BCPii gained popularity, requests for a REXX interface to the BCPii APIs came pouring in. Starting in z/OS release V2R1, that wish is now reality. Invocations of BCPii services in REXX execs are similar to those in C or assembler applications and, in some cases, even simpler.

In a REXX exec, the "address" keyword is used to step into a BCPii environment. For example, you might code the following in a REXX exec to call the BCPii HWICONN service to connect to an image:

```
inCToken = MyCPCCConnToken  
cType = HWI_IMAGE  
cValue = 'LPAR1'  
address bcp "hwiconn retCode inCToken outCToken cType cValue diag."
```

The parameter names after "hwiconn" are of your own choosing, but they must be in the correct order and must hold valid values, wherever input is required. Don't worry, you'll find excellent REXX samples in SYS1.SAMPLIB in z/OS V2R1 for all the BCPii services: HWICONN, HWIDISC, HWILIST, HWIQUERY, HWISET, HWIEVENT, and HWICMD. And to make your life easier, the public interface files shipped with BCPii, HWICIREX and HWIC2REX, contain useful constant definitions.

BCPii's REXX support is especially attractive because REXX execs are portable across all REXX environments for most BCPii services. For example, a REXX exec written for TSO/E REXX will run under z/OS System REXX, and vice versa.
